ABSTRACT

Waiting in queues and service effectiveness are essential components in the business world. The objectives of the study were to identify the waiting line management practices of AYA bank and to inspect the shorter waiting time for clients and quicker service rate delivered through application of waiting line model. The methodological used for data collection was direct observation, the recording of number of customers visit, arrival time of customers, waiting time of customers, and service time of the bank. A sample of 3525 customers was collected from Bo Aung Kyaw Branch of AYA bank during bank operating hours (9:00 am – 3:00pm) from 1st to 30th September 2019 . A single queue multiple server was used for the analysis of site observation data. The findings showed that the average arrival rate was 33 customers per hour and the average service rate was 17 customers per hour. The average queue time and average service time were 4:40 minutes and 3:60 minutes respectively. There was 0.05 probability that a customer must wait for service with the five current functional servers. This AYA branch is not only fast to serve customer but they do provide added value to customer as well. Overall conclude that AYA bank at Bo Aung Kyaw branch is a successful branch at the heart of Yangon city. This study might have significant benefits to other similar service organizations in Myanmar.

CHAPTER I

INTRODUCTION

Even in these modern days, customers at the bank have to wait for long hours to accomplish their transactions in bank. Since the foundational work of banks, many researchers try to get full advantage of any new technology to increase customer satisfaction. Therefore an active research has focused on analyzing the queues to optimize their operations and to reduce waiting time for customers (Al-Jumaily, 2011). The bank lines system and the different queuing algorithms that used in banks to serve the customers. Most banks used standard queuing models. To avoid standing queue for a long time or in a wrong line, most banks use automatic queue system to give tickets to all customers. The customer can push a specific button in a tickets supplier device according to their needs. The aim of this paper is to decrease customers waiting time (Al-Jumaily, 2011).

Many commercial banks have done great effort to increase the service efficiency and customer satisfaction but the most of them are facing a serious problem of waiting line of customers. In bank, the waiting line of customers appears due to low efficiency of the queuing system, it reflects the lacking of the business philosophy of customer centric, low service rate of the system. The waiting queues of the customer develop because the service to a customer may not be delivered immediately as the customer reaches the service facility.

Waiting time and service efficiency are the important elements for any bank. Queuing theory has been fairly a successful tool in the performance analysis of Waiting line (time)or queues is the major source of difficulties to any organization or service provider institutes like hospitals, banks etc. Queuing theory basically a mathematical approach, used for the analysis of waiting lines. It deals with the problems that involve waiting (or queuing). In a waiting line system, when considering improvements in services to offer an optimal service level, consider the cost of providing a given level of service against the potential costs from having customers waiting. Customer satisfaction is improved by predicting and reducing waiting time and adjusting staff. Proposes an

incremental analysis approach in which the cost of additional servers is compared withthe benefits it generates. Servers are added until the increase cost equal the benefits(Toshiba, S, 2013).Lack of satisfactory service facility would cause the waiting line of customers to be formed. The only technique is that the service demand can be met with ease is to increase the service capacity and increasing the efficiency of the existing capacity to a higher level.Customers waiting time depends on the number of customers on queue, the number of servers serving line, and the amount of service time for each individual customers. The time wasted on the queue would have been wisely utilized elsewhere (opportunity cost of time spent in queuing).

AYA Bank Limited is one of the leading bank in commercial banks and established in July 2, 2010. Two hundred and fifty branches had been opened until now. AYA Bank is the bank of choice for everyone who is looking for fast, reliable, honest banking relationships with reasonable cost. AYA Bank offers the full range of retail and commercial banking product and services.

1.1 Rationale of the Study

The problem in this regard had been that though bank customers for instance, have always been desirous of spending the least possible time in banking transactions, this age-long desire is yet to be met by the banks. Banks on the other hand, want to attract, retain customers and at the same time optimize profit. Profit making in banks is a function of management ability to provide efficient services to customers at little or no time wastage (Agyei, W, 2015).Economic Analysis of Queuing Systems can be used to determine operating performance of a queuing system. In economic analysis of queuing systems,service organization seek to use the information provided by the queuing model to develop a cost model for the queuing systems under study. The two basic types of costs associated with queuing systems are the costs involved in operating each service facility like the costs for equipment (including maintenance), materials, labor, etc. these cost increases as the number of service facilities put into operation increases and the opportunity costs associated with causing customers to wait in the system. Providing too much service involves excessive costs. And not providing enough service capacity causes the waiting line to become excessively long. The ultimate goal is to achieve an economic

balance between the cost of service and the cost associated with the waiting for that service.

As the number of service facilities in operation increases, the time the customer has to wait in the system, on the average, decreases, hence the cost associated. The two types of cost are in conflict because an increase in one automatically causes a reduction in the other or vice versa.The customer population will be differ in many area cluster and the implementation of service system need to suit all places. In such we will study the arrival and service pattern, waiting line priority rules application. The service receptionist utilization rate will depends on manpower availability at the particular bank.

Waiting line models are important to bank because they directly affect customer service perception and the cost of providing a service, several functional areas are affected by waiting line decisions (Eiselt. H.A, 2012). Accounting is concerned with the cost of the waiting line system used. If system average utilization is low, that suggests the waiting line design is inefficient and too expensive. Poor system design can result in overstaffing or unnecessary capital acquisitions in an effort to improve customer service, Marketing is concerned about the response time for customers. AYA bank has already implement the queuing model but how success or fail was not known yet so far. Efficient system and quick response time can be competitive advantage for AYA bank. In such, study the model and system.

1.2   Objectives of the Study

The objectives of the study are as follow:

1. To identify the waiting line management practices the AYA bank.
2. To inspect the shorter waiting time for clients and quicker service rate delivered through application of waiting line model.

1.3   Scope and Method of the Study

The method was used during the data collection are direct observation .The recording of relevant information such as; number of customers the arrival times of customers, waiting time, and service time. The observation was made during the working hours (9:00 am – 3:00pm).The recorded information was used to calculate average arrival

time, average waiting time, average service time and the utilization factor. The method of analysis for this study will use the multi-server queuing modeling system which follows (M/M/c):(∞ /FCFS) specification. Data for this study will be collected from AYA Bank Bo Aung Kyaw during the banking hours within September 2019. The secondary reference study Myanmar Bank Association published data,report from public websites,relevant books and references,articles,literature,previous thesis papers and other people documents from internet.

1.4   Organization of the Study

The study is organized to include five chapter in all. Chapter one introduces a brief background and rationale of the study along with objectives, scope and method of study. Chapter two consists of theoretical background and concepts of the study. Chapter three History of banking at Myanmar after 1962, and after liberations to become AYA Bank. Chapter four contributes effect of queuing theory activities on AYA Bank's performances. Chapter five is conclusion and gives the summary of the main findings in relation to the original aims of the study, and also presents the data based.

CHAPTER II
LITERATURES REVIEW

This chapter mainly focuses on the concept of application of waiting line theory in AYA Bank. This chapter begins with the definition of queuing. In addition , waiting line theory, queuing system and terminology, queue characteristics, queue discipline and waiting line management. This chapter end with the previous review of relevant theorical model .

2.1 Definition of Queuing

Queue is an act of joining a line or waiting. Queues are mostly formed when customers (arrivals) demanding service have to wait because their number exceeds the number of servers available or the facility does not work efficiently or takes more than the time prescribed to service a customer. It is a part of everyday human experience at banks, filling stations, barber shops, salon shops, bus-stops, supermarkets, telephone booths, computing and design of factories, toll gates and food canteens.

2.2 Waiting Line Theory

Waiting Line Theory is the congestion statistical analysis and waiting in line delays. A queuing model is built to estimate the length of the queue and the waiting time. Waiting line theory is generally regarded as an operations research branch because the findings are often used in making business decisions about the resources needed to provide a service. Waiting Line Theory discusses any aspect of line waiting to be served, including the arrival process, service process, number of servers, number of network locations, and number of customers— which could be individuals, data packets, vehicles, etc. As an organizational analysis branch, queuing theory will help users make informed business decisions on how to create productive and cost-effective workflows system. Real-life queuing theory implementations cover a wide range of applications, such as how to provide better customer service, improve traffic flow, effectively transfer orders from warehouses, and design of telecommunications systems, from data networks to call centers.

2.3 Queuing Systems and Terminology

The history of queuing theory goes back nearly 100 years. It was born with the work of A.K. Erlang who published in 1909 his paper, the theory of probabilities and telephone conversations. Erlang's motivation was to develop tools for the analysis and design of telephone systems an application that continues to the present day to motivate research in queuing theory (Shanmugasundaram and Banumathi, 2016).

According to Slack, Chamber & Johnston (2010), the dilemma in managing the capacity of a queuing system is how many servers to have available at any point in time in order to avoid unacceptably long queuing times or unacceptably low utilization of the servers. Because of the probabilistic arrival and processing times, only rarely will the arrival of customers match the ability of the operation to cope with them. Even when the average capacity (processing capability) of the operation matches the average demand (arrival rate) on the system, both queues and idle time will occur. In a queue system, the balance between dealing with all customers fairly and the performance of the system is very important (S,A .A and Huda,D., 2011). Sometimes the performance of the system is more important than dealing with the customers fairly.

2.4 Queue Characteristics

Different authors/ researchers have stated the queue characteristics using different components. Malik and Belwal, stated that the basic process of a Queuing System comprises of three (3) components: (i) the arrival pattern, (ii) the service pattern and (iii) queue discipline while Noserk Jr and Wilson stated that queuing system can be characterized by four (4) components or four main elements: the arrival, the queue discipline, the service mechanism and the cost structure. Stevenson, Krajewski, Ritzman and Malhotra also stated four (4) components: (i) population source/ calling population, (ii) arrival and service patterns, (iii) number of servers (channels) and (iv) queue discipline (order of service/ priority rule). On the other hand stated that queuing systems are characterized by five (5) components: The arrival pattern of customers; the service pattern, the number of servers, the capacity of the facility to hold customers, and the order in which the customers are served. In this study the four most commonly used components stated by the above mentioned authors will be adopted.

2.4.1 The Calling Population/ Population Source

Customer base is the source of input into the business network. Customers are not always individual in the queue management. Customers' could be, for example, vehicles arriving at a weighbridge, shipments arriving to be handled or computers waiting to be serviced, etc. (Slack, Chambers & Johnston, 2010). Population sources are available in two ways: infinite-source and finite-source populations. In the Infinite-Source case, the total number of customers greatly exceeds the device power. Infinity-source situations exist whenever the service is unrestricted (Stevenson, 2009). The infinite customer population is one in which the number of customers in the system does not affect the rate at which new customers are generated by the population (Krajewski, Ritzman, and Malhotra 2010). If the potential number of new customers in the service network is significantly affected by the number of customers already in the system (Krajewski, Ritzman and Malhotra 2010) or if the potential number of customers is reduced (Stevenson, 2009), there is a finite-source scenario. So, with a finite source of customers, the probability of a customer arriving depends on the number of customers in the region.

2.4.2 Arrival and Service Patterns

The arrival rate/ pattern are the rate at which customers needing to be served arrive at the server or servers (Slack and Johnston, 2010). It is how units (customer) joined the queues; which could be static or dynamic i.e. control depends on the arrival rate or service facility and customer. The arrival process of customers is usually specified by the inter-arrival time (the time between successive customer arrivals to the service facility). It may be deterministic (known exactly) or it may be a random variable whose probability distribution is presumed known (Bakari and Baba, 2014). The arrival cycle can be a normal arrival; that is, a Poisson distribution (a discreet probability distribution that often defines the arrival rate in the queuing theory) with an average arrival rate (Bakari and Baba, 2014) which implies that customers arrive at a service facility on a defined schedule (Heizer and Render, 2011). It could be completely random, i.e. when they do it. It could also be singly or in batches, non-stationary arrival, general independent arrival (Chamalwa and Baba, 2014).

Behavior of Arrivals

According to Heizer and Render most queuing models assume that an arriving customer is a patient customer. Patient customers are people or machines that wait in the queue until they are served and do not switch between lines. Unfortunately, life is complicated by the fact that people have been known to balk or to renege. Customers who balks refuse to join the waiting line because it is too long to suit their needs or interests. Reneging customer are those who enter the queue but then become impatient and leave without completing their transaction. Another scenario that could also exist is rejecting (Slack and Johnston, 2010). Rejecting – if the number of customers in a queue is already at the maximum number allowed, then the customer could be rejected by the system.

Number of Servers (Channels)

A server is the facility that processes the customers in the queue. In any queuing system there may be any number of servers configured in different ways (Slack and Johnston, 2010). According to Krajewski, Ritzman and Malhotra, the service system may be described by the number of lines and the arrangement of facilities. Waiting lines may be designed to be a single line or multiple lines. Service facilities consist of the personnel and equipment necessary to perform the service for the customer. Service facility arrangement is described by the number of channels and phases. The number of channels in a queuing process is the number of parallel servers available. The number of phases, on the other hand, denotes the number of sequential servers each customer must go through to complete service (Russell and Taylor, 2011). Some services require a single phase, while others require a sequence of phases.

In the single-channel, single-phase system customers form a single line and go through the service facility one at a time and get served by a single server facility. The single-channel, multiple-phase arrangement requires customers form a single line and proceed sequentially from one service facility to the next (performed in sequence by more than one facility). The multiple-channel, single-phase, arrangement on the other hand requires customers form more than one line, depending on the design, and provided the same/ different services at more than one facility. The multiple-channel, multiple-phase arrangement occurs when customers can be served by one of the first-phase

facilities but then require service from a second-phase facility, and so on (Krajewski and Malhotra, 2010).

Person
Processing point
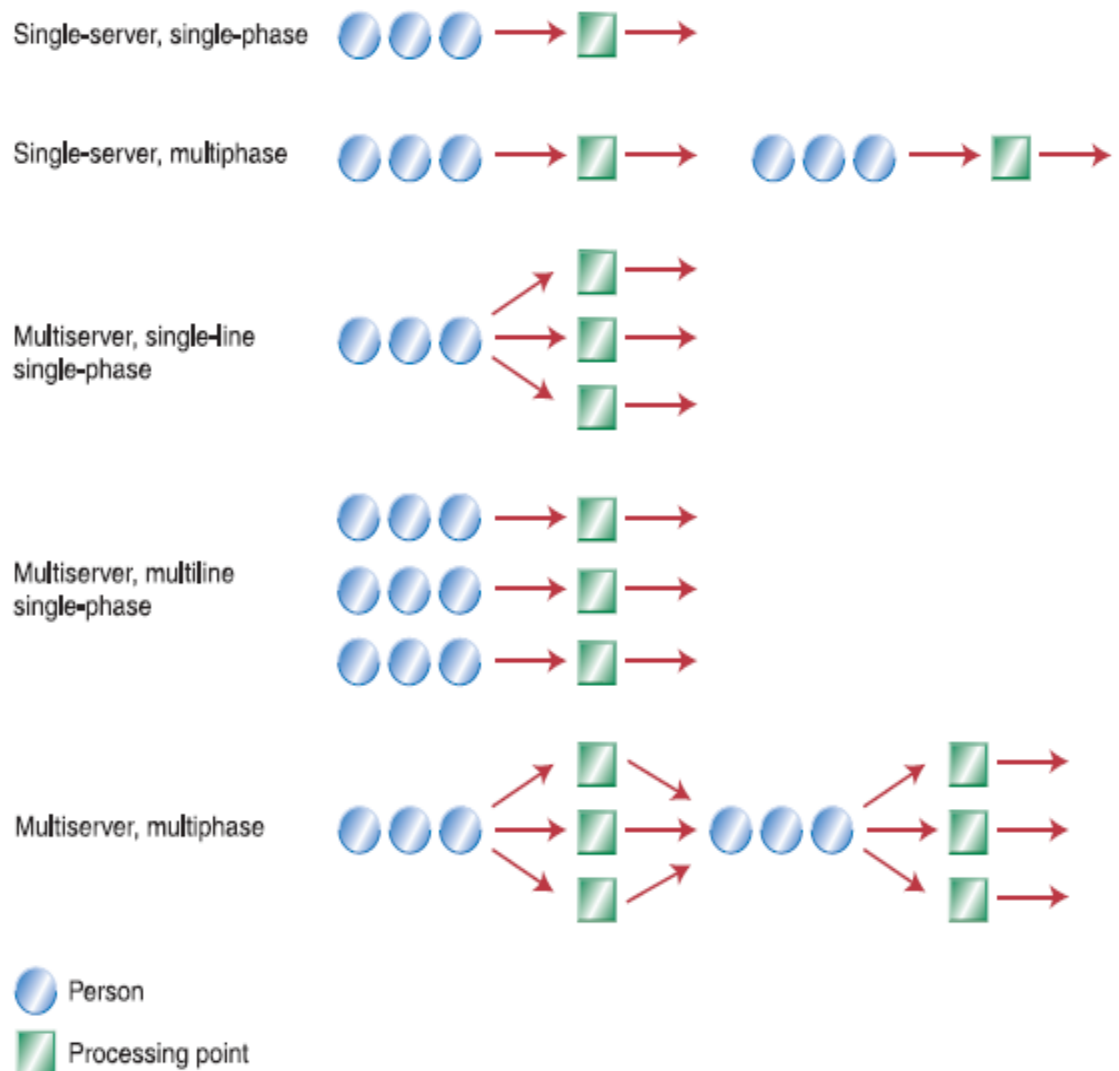

2.4.3   Queue Discipline

The queue control is the order of operation to the waiting customers. The most common type of queue discipline is first come, first served–first person or line item is

served first (Krajewski and Malhotra, 2010). Other styles also exist as last in, first out (the last part is chosen first), random (select one randomly from the full part) or predetermined (customers are scheduled to serve on a set appointment / pre-arranged schedule irrespective of when they arrive at the facility) (Russell and Taylor, 2011). In addition, priority categories may also include the customer with the earliest planned due date (EDD) or the customer with the shortest estimated processing time (SPT) or a pre-emptive discipline that enables the customer of high priority to disrupt the operation of another customer (e.g. in emergency rooms, patients with the most life-threatening injuries receive treatment first, regardless of their order of arrival (Krajewski and Malhotra 2010).

2.5   Waiting Line Management

Waiting line management systems are specially designed for banks allowing them to reduce queue lengths and increase staff productivity and operational efficiency. Nowadays the banking industry has transformed and banks are now competing for a higher share of customers wallet. This can only be achieved if banks provide exceptional service with a delightful customer experience. This solutions are equipped to make customer journey more superior and seamless. The system offers a wide range of applications from a single line queue system to a multiple line queuing system allowing to cater to a wide banking services. The queue management system makes sure that customer is entertained by the right banking representative. It is an intelligent system which is designed to increase your branch's performance and operational efficiency.

Customers arrive in a single queue and a set of them, whose number is based on the number of servers in each phase, enters the system to be served in the first phase before proceeding to the second phase, up to the cth phase. The assumptions are that each set of customers is served in k-phases set-by-set and a new service does not start until all c-phases have been completed. Moreover, the queue discipline is first come first served with infinite source. The arrival and the service times are exponentially distributed (Poisson process). The following assumption are made when model this environment:
1. The customers are patient (no balking, reneging, or jockeying) and come from a population that can be considered infinite.

2. Customer arrivals are described by a Poisson distribution with a mean arrival rate of λ (lambda). This means that the time between successive customer arrivals follows an exponential distribution with an average of $1/\lambda$.

3. The customer service rate is described by a Poisson distribution with a mean service rate of μ (mu). This means that the service time for one customer follows an exponential distribution with an average of $1/\mu$.

4. The waiting line priority rule used is first-come, first-served.

Using these assumptions, calculate the operating characteristics of a waiting line system using the following formulas:

1.The probability that there are no customers in the system (all servers are idle) is

$$P_0 = \frac{1}{\left[\sum_{n=0}^{n=c-1}\frac{1}{n!}\left(\frac{\lambda}{\mu}\right)^n\right]+\frac{1}{c!}\left(\frac{\lambda}{\mu}\right)^c\left(\frac{c\mu}{c\mu-\lambda}\right)}$$

2. The probability of n customers in the queuing system is

$$P_n = \frac{1}{c!c^{n-c}}\left(\frac{\lambda}{\mu}\right)^n P_0, \text{ for } n > c; \ P_n = \frac{1}{n}\left(\frac{\lambda}{\mu}\right)^n P_0, \text{ for } n \le c$$

1. The average number of customers in the queuing system is

$$L = \frac{\lambda\mu(\lambda/\mu)^c}{(c-1)!(c\mu-\lambda)^2}P_0 + \frac{\lambda}{\mu}$$

4. The average time a customer spends in the queuing system (waiting and being served) is

$$W = \frac{L}{\lambda}$$

5. The average number of customers in the queue is

$$L_q = L - \frac{\lambda}{\mu}$$

6. The average time a customer spends in the queue, waiting to be served, is

$$W_q = W - \frac{1}{\mu} = \frac{L_q}{\lambda}$$

7. The probability that a customer arriving in the system must wait for service (i.e., the probability that all the servers are busy) is

$$P_w = \frac{1}{c!}\left(\frac{\lambda}{\mu}\right)^c \frac{c\mu}{c\mu - \lambda} P_0$$

2.6   Previous Review

Customers waiting in line to receive services in any service system are inevitable (Obinwanne and Darlingtina, 2015), or queues are omnipresent (Banumathi, 2016) meaning that while sometime demand may be satisfied instantly, at other times customers may have to wait (Slack and Johnston, 2010) whenever the capacity of a service provider fails to meet the instantaneous demand (Conte and Scarsini, 2016). A waiting line is one or more "customers" waiting for service. The customers can be people or inanimate objects, such as machines requiring maintenance, sales orders waiting for shipping, or inventory items waiting to be used (Krajewski and Malhotra, 2010). Businesses of all types, industries, schools, hospitals, cafeterias, book stores, libraries, banks, post offices, petrol pumps, theatres – all have queuing problems (Banumathi, 2016) and so everyone experienced the inconvenience of waiting in line when approaching these businesses to get the respective services. Because time is a valuable resource, the reduction of waiting time is an important topic of analysis (Taylor, 2013).

Waiting lines form because people or things arrive at the servicing function, or server, faster than they can be served (Taylor, 2013) or at unpredictable intervals (Krajewski and Malhotra, 2010). However, this does not mean that the service operation is understaffed or does not have the overall capacity to handle the influx of customers. In fact, most businesses and organizations have sufficient serving capacity available to handle their customers in the long run. Waiting lines result because customers do not arrive at a constant, evenly paced rate, nor are they all served in an equal amount of time (Taylor, 2013). Most often, the rate of producing the service also varies, depending on customer needs (Krajewski and Malhotra, 2010). Thus, a waiting line is continually

increasing and decreasing in length (and is sometimes empty), and it approaches an average rate of customer arrivals and an average time to serve the customer in the long run (Taylor, 2013).

Waiting lines are non-value added occurrences. In lean systems, waiting is one of the seven wastes (Stevenson, 2009). Queuing has become a symbol of inefficiency of publicly funded bank in the world. For customers, having to wait for service can range from being acceptable (usually short waits), to being annoying (longer waits), to being a matter of life and death (e.g., in emergencies). For businesses, the costs of waiting come from lower productivity and competitive disadvantage. For society, the costs are wasted resources (e.g., fuel consumption of cars stuck in traffic) and reduced quality of life. Hence, it is important for system designers and managers of existing service systems to fully appreciate the impact of waiting lines (Stevenson, 2009).

According to Taylor, the improvement of service with respect to waiting time has also become more important in recent years because of the increased emphasis on quality, especially in service-related operations. Customers are increasingly equating quality service with rapid service. Aware of this, more and more companies are focusing on reducing waiting time as an important component of quality improvement. Stevenson added that one reason that queuing analysis is important is that customers regard waiting negatively. Customers may tend to associate this to poor service quality, especially if the wait is long.

According to Stevenson there are several managerial implications of waiting lines, the chief among those reasons being: - the cost to provide waiting space; a possible loss of business should customers leave the line before being served or refuse to wait at all; a possible loss of good will; a possible reduction in customer satisfaction and the resulting congestion that may disrupt other business operations and/or customers.

Queuing management has been applied very successfully in many service-oriented industries. The applications were to optimize staffing levels, to identify an optimal configuration of capacity and staffing levels, to significantly improve employee morale and reduce operating costs and to virtually eliminate long lines and greatly improve customer satisfaction (Nosek and Wilson, 2001). From the empirical studies

reviewed it was observed that different queuing applications or queuing management techniques were used/ suggested to manage waiting lines.

A study conducted by Conte and Scarsini on the impact of time limitation on judgment and decision making by applying a queuing experiment tried to answer the question of whether customers accurately calculate the costs and benefits of joining a queue and make their decision accordingly. The study contributes to the characterization of customers' queuing behavior by experimentally examining the situation in which subjects need to choose between two queues under different treatment conditions of time allowance. Their analysis suggests that, with no time limitation, a considerable proportion of the population behaves consistently with the principles of rationality, which require comparing the profits of joining each queue. Time limitation increasingly harms decision performance and decreases that proportion. Another interesting result they obtained was that, when introducing time limitations, decision performance worsens significantly even if the time allowance is more than what is used under the no time limitation treatment. And so they stated that this observation supports the idea that it is the existence of a limitation but not the insufficiency of the time allowance that harms the performance.

S.A and Huda in their study on application of automatic queuing model for banking system presented a new technique for queuing system called automatic queuing system. The proposed technique showed improvements in average waiting time. They also indicated that in future work it will be more effect to add more factors in testing to take the right decision for choosing one of the available scheduling algorithms, such as throughput, utilization, and response time.

Jhala and Bhathawala in their study on Smart Queue Management System for Banking Sector introduced a new way of queue management system called as Queue Management System with SMS notification which will issue a queue ticket to a customer and later announce the ticket number when service is available, eliminating the need to stand in line while waiting. In this way, queue management systems help to provide comfort as well as fairness to customers, by allowing them to maintain their position in the queue while they are seated comfortably or engaged in constructive activity. It reduces queue length and actual waiting times, thus improving customer satisfaction. It enhances the productivity and motivation of the staff providing excellent customer

service. After sending a text "Q" to the number tagged to the branch they want to visit customers will receive their queue number as well as the number of customers that are being served ahead of them. If there is a longer wait time, customers will also receive a reminder SMS when their turn is nearing. Once their turn is up, customers can proceed directly to their assigned counter. If they miss their turn, they will receive an SMS with the option to rejoin the queue. For those customers who are not having mobile phones and for those who are not comfortable to use SMS facility, branch staffs are at hand to assist them to provide them with appointment time through telephonic facility. There is no difference in queue priority if customers opt for either the SMS or telephonic facility to get appointment.

A research by Paul, Adullahi and Halilu on the implementation of a queuing model/waiting line to boost service quality in higher institutions (Nigeria) found that more than 60 per cent of students considered the queue of students to be long/very long; whereas 40 per cent of students regard the attitudes of registration officers as n. The key findings of the study were: lack of full online registration, lack of adequate staff at different service points with the facilities needed relative to student inflows, too short a time of registration, and the disruptive conduct of some students and staff members are factors contributing to long queues.

Mwang, S. In their empiric study of the queuing model and the queuing behaviour in relation to customer satisfaction, Ombuni, T (2015) established that switching to a multi-server system helps consumers in terms of the time they wait to be served. Students (JKUAT university students) were found not happy with the waiting time and would prefer to pay school fees during the semester in order to avoid long queues at the beginning or the end of the semester. With regard to the service rate, students in all years of study feel that it is poor and that it can be improved by increasing the number of staff and by working harder. In the case of arrival actions, senior students were found to solve the queuing problem by jumping the queue. Here, females were found to be less accommodating and to solve the problem by completely abandoning the queue only to come back another day, while males tend to come back on the same day. The queuing system in use (which takes 33.4 minutes to serve, and is considered to have a shortage of accounting clerks and servers) was also found to be not efficient because it creates a

queuing problem to such an extent that some students choose to jump the queue to solve the problem, while others resolve it by leaving the queue and returning the same.

The number of channels open and phases available for customers as elements of waiting line structure affects the extent of implementation of practices in such areas. Customers were also identified to be happy with the implementation of the first come, first serve priority rule of the restaurants and the way they handle elderly, pregnant and differently abled customers. Customers are generally not so satisfied with the existing service facility of the restaurants, which includes the number of channels open, the service time and other facilities provided to ease the discomfort or boredom of the customers while waiting in line. There is an inadequate facility to be used by the customers while waiting in line or to occupy the time of the customers while waiting. The customers regard the use of the queuing number system, electronic display board and streamlined process as important components of service facility that provide satisfaction to customers. The waiting line structure also affects the level of satisfaction of the customer specifically in terms of waiting line and service facility. Customers want a structure that will facilitate fast and a convenient order taking and picking. Specifically, based on findings it could be concluded that the customers prefer two–channel, single phase and three channel single phase system.

2.7   Summary of Literatures Reviewed

Customers do not simply demand for quality but they also demand for speed. Waiting in a queue is irritating, frustrating and, hence, costly. What determines customer behavior is the comparison between the expected benefit of getting the service and the expected cost of waiting (Conte and Scarsini, 2016).

Different authors/ researchers have stated the queue characteristics using different components. Malik and Belwal stated that the basic process of a Queuing System comprises of three (3) components: (i) the arrival pattern, (ii) the service pattern and (iii) queue discipline while Noserk Jr and Wilson (2001) stated that queuing system can be characterized by four (4) components or four main elements: the arrival, the queue discipline, the service mechanism and the cost structure. Stevenson, Krajewski, Malhotra, Slack, Russell and Taylor also stated four (4) components: (i) population source/ calling

population, (ii) arrival and service patterns, (iii) number of servers (channels) and (iv) queue discipline (order of service/ priority rule). On the other hand stated that queuing systems are characterized by five (5) components: The arrival pattern of customers; the service pattern, the number of servers, the capacity of the facility to hold customers, and the order in which the customers are served. In this study the four most commonly used components (calling population, arrival and service patterns, number of servers/ channels and queue discipline) stated by the above mentioned authors were adopted.

Traditionally, a queue is studied in the perspective of operations research, using mathematical models to determine the efficiency of the queue under particular settings. However, it has been shown that it solves only part of the problem, the efficiency of the process, while the application of these results to real-world service operational settings is restricted because it does not take human factors into consideration. This indicates that studies conducted on the area of queuing management/ customers' waiting line used to lack showing concern on the related customer satisfaction and the physiological aspects of/ customers' perceptions of waiting. From the empirical studies reviewed it was observed that different mechanisms and methods (like automatic queuing systems, self services facilities, SMS notification for queue tickets, improvement to the waiting environment information provided, etc.) which will make the customers waiting more tolerable or which will make them feel less irritated to the waiting line were suggested.

CHAPTER III
THE PROFILE OF AYA BANK LIMITED

The financial sector is the lifeblood of any country's economy and its smooth operation is essential to the fast and sustainable growth of the economy. A well-functioning financial system must be an efficient broker between savers and borrowers; manage risks prudently, provide a wide range of financial services to firms, farms and households; mobilize savings effectively to identify and lend to sound investment. This chapter highlights the profile of AYA Bank Limited, describes the bank's structure, its vision, mission, goals, core value and brand promise, the expansion of branches and financial services provided by the bank within (9)years of its business life.

3.1   Banking Sector in Myanmar

There is a lack of public trust in the banking sector, and this is not surprising given Myanmar's financial history. In 1962, the Revolutionary Council government nationalized all privately owned banks in the country. Later, the military government merged all banking into a single entity that would later be dismantled into four separate state-owned banks. In the early 1990s, the market was opened again to privately owned banks, but the 1997 Asian financial crisis, Myanmar's 2003 domestic banking crisis, and international sanctions severely impaired the development of the sector.

Much of the sector's growth has been driven by domestic privately owned banks, whose own balance sheets have expanded by over 1,000 percent since 2010. In a notable development, the percentage of assets managed by privately owned and semi-private banks now surpasses those managed by purely state-owned institutions. In early 2016, privately owned banks held approximately 52 percent of banking assets, compared to around 48 percent held by state-owned banks. Privately owned banks, moreover, have much larger loan books than those managed by their state-owned counterparts. In early 2016, loans comprised an estimated 61 percent of assets held by privately owned banks, compared to 15 percent of assets for state-owned banks.

On the liability side of the balance sheet, privately owned banks have similarly taken the lead on expanding the deposit base. In 2013, total deposits were split evenly between privately owned banks and state-owned banks, yet by 2016, 64 percent of total deposits were placed in privately owned banks. Myanmar businesses have accessed bank loans to finance investments, while around 11 percent have put bank loans to use as working capital.

Today, there are 28 domestic banks operating in Myanmar. This number includes four state-owned banks, three banks owned by municipal governments, 10 semi-private banks that trade privately but are partially owned by, or closely associated with, government agencies, and 14 privately owned banks. The country's banks by category, while Box A below provides brief descriptions of several major banks. Among the privately owned banks, the so-called "Big Three" dominate the market. Combined, Kanbawza Bank (KBZ), Ayeyarwady Bank (AYA), and Co-operative Bank (CB) control about two-thirds of all loans, two-thirds of all deposits, and more than 50 percent of all bank branches in the country. The Big Three are also expanding more rapidly than smaller banks, adding 60 new branches as a group between August 2014 and May 2016, compared to only seven new branches for the rest of the banking industry combined.Although banking-sector concentration is typical in ASEAN, the limited absolute size of Myanmar's overall banking market makes it difficult for the country's smaller banks to become competitive.The four state-owned banks are Myanmar Economic Bank, Myanmar Foreign Trade Bank, Myanmar Investment and Commercial Bank, and Myanmar Agricultural Development Bank. While distinct in their operational scope and policy mandates, these banks have several challenges in common.First, they lack transparency and often fail to report financial performance data. Second, their policy mandates appear to be outdated or unclear. Additionally, as is also the case with their privately owned competitors, state-owned banks require major investments in information technology and human capital.

3.2   Brief Description of the AYA Bank Limited

Ayeyarwady Bank Ltd. (AYA Bank) is a private bank in Myanmar. AYA Bank was established on 2 July 2010 with the permission of the Central Bank of Myanmar.The

AYA Bank's head office is located in the Rowe Building Kyauktada Township of Yangon.

The bank has grown rapidly over the past nine years to become the second largest in the country, with [258] branches, [1.4m customer], Kyat [4.7] trillion customer deposits and [150 billion] Shareholders' Equity as at the end of September 2019. Top 100 depositors represent about 15 % of total deposits, underlining the general public's confidence in the bank.

As a member of the UN Global Compact (UNGC), AYA Bank is committed to implement global standards in Corporate Governance and compliance best practices in its management and operations. Consequently, since 2014-15, AYA Bank is the only bank in Myanmar to be IFRS compliant and the only one audited under International Standards of Auditing (ISA) by a big-four international firm. The bank has also attracted and retained talented staff with both domestic and international exposure and has invested significantly in Learning & Development as a way to ensure long-term sustainable growth for the communities it serves.

In a short period of 9 years, AYA Bank has become the second largest private bank in Myanmar. Concurrently, AYA Bank has won a hard-earned reputation for transparency and integrity with regulators, customers and staff. AYA Bank is the first private bank to submit to voluntary Human Rights Audit to ensure all Human Resources policies conform to ILO guidelines implementing non-discrimination policies resulting in becoming an equal opportunity employer with zero gender salary gap. 3 out of 8 Board members are Independent Non-Executive Directors. AYA Bank is the first bank in Myanmar to introduce Centralized Core Banking System (access to data), the first to introduce mobile and internet banking platforms (democratization of financial services), the first to adopt International Financial Reporting Standards (IFRS – standardized financial transparency) and to undergo international audit (Deloitte). This is evidence of commitment across all levels of the organization.

Ayeyarwady Bank received its banking license from the Central Bank of Myanmar on 2 July 2010 and began operations on 11 August 2010. The bank is authorized to operate as an investment or development bank for the domestic market and the approved banking activities include:

1) Borrowing or raising of money

2) Lending or advancing of money either secured or unsecured

3) Receiving securities or valuables for safe custody

4) Collecting and transmitting money and securities

5) Cash management system

6) Internet banking

7) Provision of international banking services including international remittance, payment and trade services

8) Mobile Banking

3.2.1 Excellent Customer Services

In order to enable the customers to be delighted, staff members of the bank are possessing good personal relationship together with positive words of mouth, creating AYA Bank's good reputation, gaining more loyal customers, eventually enlarging long term beneficial relationship between customers and the bank both financially and socially.

3.3 Core values and Brand Promise

To be recognized as the leading bank in Myanmar through pursuit of excellent and long term sustainable growth for the bank and its stakeholders.

Corporate Values-Ethics

1) pursues our objectives with EXCELLENCE

2) progress as a TEAM

3) think and act in all HONESTY

4) maintain INTEGRITY in all our dealings

5) CARE for our customers, our colleagues and the people we interact with and in all our actions,

6) always act with SINCERITY

3.3.1 Brand Promise – Your Trusted Partner

AYA Bank is the bank of choice for anyone who is looking for fast, reliable, honest banking relationships at reasonable cost. AYA Bank offers the full range of retail

and commercial banking products and services and is in tune with domestic customs and international standards in its governance and operations. For your long term banking needs, AYA bank is your trusted partner in Myanmar.

3.4   Financial Services Rendered by AYA Bank Limited

Yangon, Myanmar. AYA Bank (Ayeyarwady Bank) announced today that they have signed on "mobile Fintech (mFimo)" for advanced payments, commerce and banking solutions for the Myanmar market. As one of the top banks in the country, AYA Bank is continuously striving to deliver new Fintech experiences for their customers, as well absorbing Myanmar's large under banked and unbanked segments under the umbrella of financial inclusion with its new offerings.

The financial services sector of Myanmar is very dynamic, and there is a desire to modernize financial institutions from both the bank's and the end user's perspective. That is why AYA Bank is actively pushing for the adoption of advanced payments solutions by its customers. For example, frictionless payment experiences such as QR code payments have not yet found a strong foothold in Myanmar, mainly due to lack of infrastructure and awareness among users. There is an urgent need to offer simple, credible solutions to attract and encourage the under banked. As Myanmar is witnessing strong growth in internet usage and mobile penetration, AYA Bank is determined to leverage this trend to reach out to the under banked and unbanked, encouraging them with basic banking services accessible through easy-to-use interfaces on any mobile phone. The overreaching goal is to achieve financial inclusion through reliable, secure banking services, which will drive rapid business and economic growth in the near future.

"mFino" brings their global expertise and experience to customize AYA Bank's offerings for the Myanmar market and its mobile wallet with agency banking support is geared towards making AYA Bank a modern financial institution. AYA Bank's customers will be empowered to perform financial transactions such as deposits, withdrawals, bill payments, top-ups and P2P(peer to peer) transfers through the wallet or at authorized agent locations. AYA Bank is also working to build a strong merchant ecosystem by introducing offerings such as in-store payments along with loyalty and reward programs tied to the wallet, mobile wallet solution.

3.4.1   Major financial services products of AYA Bank are

1.   Deposit

(a)   AYA Current Account

AYA Current Account is a non-interest bearing account suitable for businesses that engages in regular business / financial transactions. Customer can make a payment easily with the tools provided.

(b)   AYA Foreign Currency Account

Foreign currency account is a non-interest bearing current account and is designed for customers who want to minimize foreign exchange risk while maximizing payment efficiency in foreign currency.

(c)   AYA Seafarer Saving Account

AYA Seafarer Saving Account (AYA SSS) is a package of banking products and services designed especially for Myanmar seafarers. The product package consists of a Demand Account in USD, a Savings account in Kyat and AYA Debit card. Seafarers will be able to conveniently remit their payroll to their bank account. The seafarers or the joint account holders will have easy access to funds whenever needed.

(d)   AYA Saving Account

Saving account is an interest bearing account for individuals who want to save and earn interest on the excess cash. By opening this account, account holder can inculcate frugal behaviour by saving for rainy days.

(e)   AYA Fixed Deposit

AYA Time Deposit is ideal for the individual who has excess cash for an extended period of time. The account is opened for a particular fixed period (time) by depositing particular amount (money) and withdrawal is only allowed at the end of the particular period.

(f)   AYA Premium Saving Deposit

AYA Premium Deposit is an interest bearing deposit account for individuals who want to save and earn daily interest. AYA Premium Saving helps people to develop frugal behaviour by rewarding a higher interest to account holders.

2.   Loan and advances

AYA Education loan, AYA Auto loan, AYA home loan, AYA SME financial solution, personal loan and corporate loan.

3.   Remittance

(a)   Local Remittances

A telegraphic transfer is the quickest means whereby the beneficiary generally receives payment within 24 hrs of dispatch in local or foreign currency.

(b)   AYA World Remittances

AYA World Remit allows you to send money easily and securely to your friends, family and business partners around the world simply and affordably.

4.   Payment Order

Payment order is a form of payment settlement to individual, company and associations. It can be purchased at any AYA branches. Payment order is designed as a normal payment order to pay a particular amount for a third party that is not a Bank.

5.   Card Payment

(a)   Debit Card

AYA debit card helps the customer in paying for goods and services through electronic channels.

(b)   Credit Card

AYA Credit Card is a convenient way of borrowing money to pay for goods and services. Using your credit card, you can make your purchases in stores, restaurants, service providers, and online services. No initial deposit required to get the cards.

3.5   Operations of Commercial Banks

The primary operations of commercial banks include:

1) Keeping money safe while also allowing withdrawals when needed

2) Issuance of cheque books so that bills can be paid and other kinds of payments can be delivered by the post

3) Provide personal loans, commercial loans, and mortgage loans (typically loans to purchase a home, property or business)

4) Issuance of credit cards and processing of credit card transactions and billing

5) Issuance of debit cards for use as a substitute for cheques

6) Allow financial transactions at branches or by using automatic teller machines (ATMs)

7) Provide wire transfers of funds and electronic fund transfers between banks

8) Facilitation of standing orders and direct debits, so payments for bills can be made automatically

9) Provide overdraft agreements for the temporary advancement of the bank's own money to meet monthly spending commitments of a customer in their current account.

10) Provide internet banking system to facilitate the customers to view and operate their respective accounts through internet.

11) Provide charge card advances of the bank's own money for customers wishing to settle credit advances monthly.

12) Provide a check guaranteed by the bank itself and prepaid by the customer, such as a cashier's check or certified check.

13) Notary service for financial and other documents

14) Accepting the deposits from customer and provide the credit facilities to them.

15) Sell investment products like mutual funds Etc.

3.6 Waiting Line Management Practice in AYA Bank.

Myanmar is opening more market to foreign banks and micro environmental force is growing. Bank would like to upgrade their system and skills to gain more market domination is necessary. Customer satisfaction has been a concern for most organizations as seek to improve on their operational strategies that can result in reduction of customer complains especially on waiting lines management. AYA commercial banks manage their waiting lines through placing physical barriers. This enables queue discipline which is on first come first serve basis. AYA banks have also tried to manage waiting lines through implementation of certain measures like, Mobile banking, Internet banking, Visa ATM debit cards, Credit cards and Pay bill systems. These measures are implemented in AYA banks but that has not been enough measures to minimize and manage waiting lines in the banks due to some inconveniency that comes with these services hence queues are still found in the banks. That is some of these measures come with a high cost, i.e. pay bill system and mobile banking where customers pay school fees, utility bills and other bills has proved to be quiet expensive. At times there is systems breakdown e.g. poor internet which does not allow access to internet banking and confirmation of bank statements online. Small branch network within central business district and also country wide . Mobile banking unreliability where a few seconds of system down time caused by unstable performance servers or insufficient technical support cause loss of profit and negative effect on trust relationship between customers and bank. These are the main challenges that make customers prefer visiting the bank and transact from there, therefore there end up having long waiting lines in the bank. In such we need review our waiting line system to survey and measure the problem.

Whenever customer step into the glass door, the cheerful staff will greet at you with huge smile. They will guide you to get the queue ticket from queue number to serve to you. The bank has one queue machine and five service counters. Each counter will serve the following service such as cash deposit and withdraw, new account opening, and remittance. The counter will work throughout the bank operating hours. Each counter will

serve all the customer, based on the ascending queue no. If your queue no miss due to some reason, customer need to approach to usher service girl and she will let you back what is your turn at which counter. Normally customer need to wait not more than a few minute after taking the queue no to serve.

CHAPTER IV
ANALYSIS OF WAITING LINE MODEL IN AYA BANK

This study had utilized methodology for the data collection and the set objectives. The main objective of this research was to find out how waiting lines management influences customer satisfaction in AYA Bank. To achieve the main objective, the study determined the effect of waiting lines management on customer, how commercial banks manage waiting lines and the challenges faced by commercial banks while managing waiting lines. Site observation was used as methodology and Bo Aung Kyaw branch of AYA Bank was selected for data collection. This branch was collected based on the made by management after briefing about the objectives of the study. As automatic queuing system was present at this branch, printed sequential numbers to each arriving customer with the arrival time recorded on them. Customers were served on first come first served basis at this branch. And so, when a customer was ready (when it was his/her turn) to be assigned to a call service counter the sequential queue number on which the arrival time recorded was collected from the customer, and then recording of the customer number, recording of the server number to which was assigned, recording of service start time and service end time. Accordingly, the data was collected for a total of 3,525 customers during the period between 2019 Sept 1 to Sept 30. Data computations using single queue -multiple server queuing model was used for data analysis.

4.1 Data Computation Analysis and Interpretation of the Observational Data Queuing Model for Data Analysis (Single-Queue Multiple Servers Model (M/M/c)

In the single-channel multiple servers system, two or more servers or channels are available to handle arriving customers. Assume that customers awaiting service form one single line and then proceed to the first available server. As observed in Bo Aung Kyaw branch, the current practice is using single-queue, multiple servers for queue management and hence, the data analysis was made from this model perspective.

Figure 4.1 Single channel multiple server waiting line
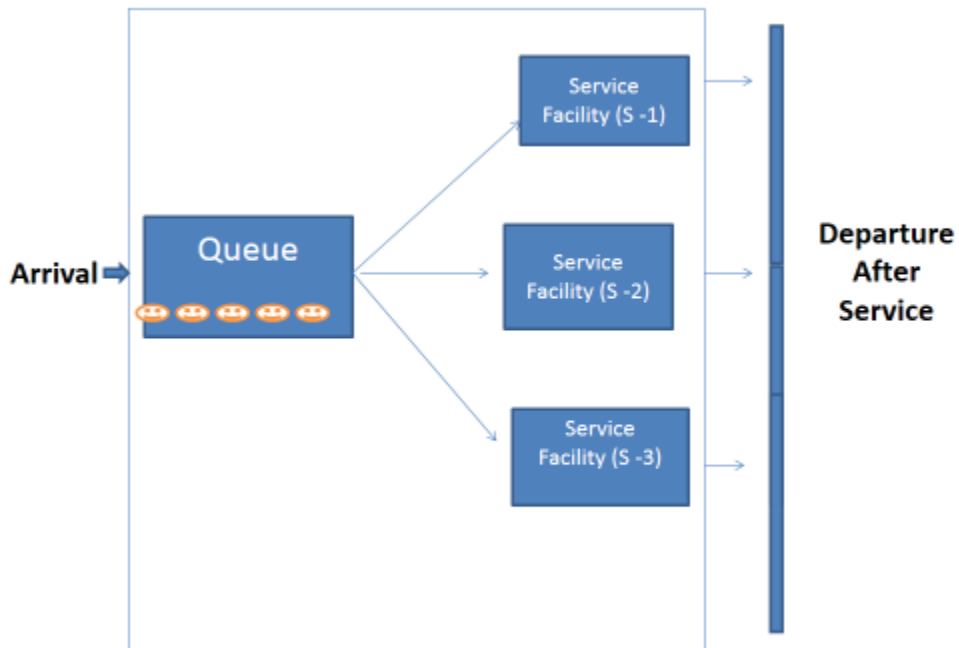

The assumptions & formula are:

The first M refers to the fact that the inter-arrival time is Markov and the second is the fact that service distribution is exponential and hence markovian.

- In an M|M|c queue, there are s parallel servers, each serving customers, (c>1).

- The arrival process and service process follow Poisson distribution .

- Service is first-come, first-served (FCFS),

- There is an infinite population from which customers originate with unlimited queue length

- All arriving customers after entering the service system join a single queue.

- Hence the utilization factor for the M|M|c service system will be $\rho = \lambda / c\mu$

The parameters of the multiple-server model are as follows:

λ ＝ the arrival rate (average number of arrival per time period)

μ　＝　the service rate (average number served per time period) per server (channel)

c　＝　the number of servers

$c\mu$　＝　the mean effective service rate for the system, which must exceed the arrival rate

1. The probability that there are no customers in the system (all servers are idle) is

$$P_0 = \cfrac{1}{\left[\displaystyle\sum_{n=0}^{n=c-1} \frac{1}{n!}\left(\frac{\lambda}{\mu}\right)^n\right] + \frac{1}{c!}\left(\frac{\lambda}{\mu}\right)^c\left(\frac{c\mu}{c\mu-\lambda}\right)}$$

2. The probability of n customers in the queuing system is

$$P_n = \frac{1}{c!c^{n-c}}\left(\frac{\lambda}{\mu}\right)^n P_0, \text{ for } n > c; \quad P_n = \frac{1}{n}\left(\frac{\lambda}{\mu}\right)^n P_0, \text{ for } n \le c$$

3. The average number of customers in the queuing system is

$$L = \frac{\lambda\mu(\lambda/\mu)^c}{(c-1)!(c\mu-\lambda)^2}P_0 + \frac{\lambda}{\mu}$$

4. The average time a customer spends in the queuing system (waiting and being served) is

$$W = \frac{L}{\lambda}$$

5. The average number of customers in the queue is

$$L_q = L - \frac{\lambda}{\mu}$$

6. The average time a customer spends in the queue, waiting to be served, is

$$W_q = W - \frac{1}{\mu} = \frac{L_q}{\lambda}$$

7. The probability that a customer arriving in the system must wait for service (i.e., the probability that all the servers are busy) is

$$P_w = \frac{1}{c!}\left(\frac{\lambda}{\mu}\right)^c \frac{c\mu}{c\mu - \lambda} P_0$$

4.1.1   Data Computations and Interpretations

The first objective of this study was to measure the arrival rate at Bo Aung Kyaw branch, the average waiting time in queue & the average service time and analyze its alignment with the standard time defined by the bank. Accordingly, the data was collected for a total of 3525 customers in this branch. Based on the data collected from banking hours (9: 00 to 3:00) in Bo Aung Kyaw branch as a whole are computed as presented in Table 4.1 below.

Table 4.1 Analysis of Arrival Patterns at Bo Aung Kyaw Branch

Analysis of Arrival Patterns at Bo Aung Kyaw Branch			
Date	Time observation	Number of customer observed	Number of function servers
2 / 09 / 2019	9:00 – 15:00	255	5
3 / 09 / 2019	9:00 – 15:00	274	5
4 / 09 / 2019	9:00 – 15:00	211	5
9 / 09 / 2019	9:00 – 15:00	162	5
10 / 09 / 2019	9:00 – 15:00	159	5

11 /09 / 2019	9:00 – 15:00	277	5
12 / 09 /2019	9:00 – 15:00	179	5
16 / 09 / 2019	9:00 – 15:00	172	5
17 / 09 / 2019	9:00 – 15:00	174	5
18 / 09 / 2019	9:00 – 15:00	169	5
19 / 09 / 2019	9:00 – 15:00	156	5
20 / 09 / 2019	9:00 – 15:00	206	5
23 / 09 / 2019	9:00 – 15:00	175	5
24 / 09 / 2019	9:00 – 15:00	173	5
25 / 09 / 2019	9:00 – 15:00	148	5
26 / 09 /2019	9:00 – 15:00	165	5
27 / 09 / 2019	9:00 – 15:00	236	5
30 / 09 /2019	9:00 – 15:00	234	5
Total number of hours observed	108 hours		
Total number of observed customers	3525		
Average arrival rate for Bo Aung Kyaw branch	3525/108 = 32.6 = 33 Customers		
Average number of functional servers/hour	5		

Source : Servia data (2019)

By analyzing the average waiting time in queue, the average service time and the average queue length to serve a customer for Bo Aung Kyaw branch is as presented below.(the detail records for 3525 observation is shown in the Appendices.)

 Table 4.2 Analysis of average queue time,service time and queue length

Description	Average queue time (minutes)	Average service time (minutes)
Time	4:40	3:60
Service rate $(1/\mu)$ = Average service minutes	3.6 minutes/person	

per person	
Service rate (μ)= customer per minute per counter	1/3.6 = 0.28
Service rate (μ) = customers per hour at each counter	17 (0.28 *60)
5 counters on average can serve	85 (5*17)

Source : Servia data (2019)

According to above result (Table 4.2) it can be seen that both the average queue time and the average service time are within the standard time set by the bank (i.e. 3.6 minutes) when the average is considered over all for Bo Aung Kyaw branch. Nevertheless, it can be seen to consider the average of only Bo Aung Kyaw branch, the average time the customer spends at Bo Aung Kyaw branch could become 10 minutes which is few higher than the standard time defined. Again it could be longer waiting time if some of the busiest braches like Kyauktada, Pansodan ,Wardan and Latha.but all sets the level of 10 minutes as the maximum.

4.1.2 Application of Single –Queue Multiple Server Queue Formulas

Based on the above findings on the average arrival rate, queue time, queue length, and service time, the analysis of the queuing system could be made as follows using single-queue multiple servers model (M/M/5)

λ = 33 customer per hours

μ = 17 customers per hour

c = 5 servers

cμ = 85

The probability that there are no customers in the system is

$$P_0 = \cfrac{1}{\left[\displaystyle\sum_{n=0}^{n=c-1} \frac{1}{n!}\left(\frac{\lambda}{\mu}\right)^n\right] + \frac{1}{c!}\left(\frac{\lambda}{\mu}\right)^c\left(\frac{c\mu}{c\mu-\lambda}\right)}$$

P0 = 1/ [1/0! (33/17)0+ 1/1! (33/17)1 + 1/2! (33/17)2 + 1/3! (33/17)3 + 1/4! (33/17)4] + 1/5! (33/17)5 (5(17)/ 5(17) – 33]

= 0.14 probability that no customers are in the service center

The average number of customers in the queuing system is

$$L = \frac{\lambda\mu(\lambda/\mu)^c}{(c-1)!(c\mu-\lambda)^2} P_0 + \frac{\lambda}{\mu}$$

L = [[33(17) (33/17)5] / [4! (85-33)2]] (0.14) + (33/17)

= 1.98 customers on average, in the service center

The average time a customer spends in the queuing system (waiting and being served) is

$$W = \frac{L}{\lambda}$$

W = 1.98/33

= 0.06 hr. (3.6 min.) average time in service center per customer

The average number of customers in the queue is

$$L_q = L - \frac{\lambda}{\mu}$$

Lq = 1.98 – (33/17) = 0.04 customer on average should be waiting to be served

The average time a customer spends in the queue, waiting to be served, is

$$W_q = W - \frac{1}{\mu} = \frac{L_q}{\lambda}$$

Wq = 0.04/ 33

  = 0.0012 hr. (0.07 min) average time waiting in line per customer

The probability that a customer arriving in the system must wait for service

$$P_w = \frac{1}{c!} \left(\frac{\lambda}{\mu} \right)^c \frac{c\mu}{c\mu - \lambda} P_0$$

Pw = 1/5! (33/17)5 [85/ (85-33)] (0.14)

  = 0.05 probability that a customer must wait for service

Table 4.3: Summary of Results obtained from mathematical analysis (5 servers)

Po	0.14 probability that no customers are in the service center
L	1.98 customers on average, in the service center
W	3.6 minutes average time in service center per customer
Lq	0.04 customer on average should be waiting to be served
Wq	0.0012 hr. (0.07 minutes) average time waiting in line per customer
Pw	0.05 probability that a customer must wait for service

Source : Survey Data (2019)

According to the above results, the average service time in service center per customer which became 3.6 minutes,which is same as the overall average computed through observation data. To modify the above result , if Bo Aung Kyaw branch management could decide to consider the reduction 1 extra service representatives/ counter (i.e. ensure that at least 4 service counters are fully functional to serve the customer.

Table 4.4: Summary of Results obtained from mathematical analysis (4 servers)

Po	0.139 probability that no customers are in the service center
L	2.1 customers on average, in the service center
W	3.6 minutes average time in service center per customer
Lq	0.16 customer on average should be waiting to be served
Wq	0.005 hr. (0.3 minutes) average time waiting in line per customer
Pw	0.16 probability that a customer must wait for service

Source : Survey Data (2019)

After reducing one channel above data was calculated. The queuing operating characteristics provide input into the decision-making process, and the decision criteria are the waiting costs and service are not difference and same value as (W: 3.6) and the probability that a customer must wait for service (from Pw:0.05 to 0.16), in making a decision (Table 4.4). This can be possible also that one queue machine to serve four or five channel at continuous for all products.

According to this study it was observed that the arrival rate varies from 148 to 277 customers per hour while the overall average is 33 customers per hour, while 5 fully functional servers were available on average per hour based on the computation made using queue analysis model. The time a customer spends at Bo Aung Kyaw branch could also range from as minimum as 1 minute to as high as 50 minutes, and the average time ranging between 17 minutes and 21 minutes. It seems that Bo Aung Kyaw branch is meeting the set standards of 15 minutes of queue time and 3 minutes of service time.

The queue analysis conducted using queuing model also depicts that currently a customer has 5% of probability of waiting for a service at Bo Aung Kyaw branch, considering the number of transactions, customers being served under the center. Customers had also indicated the same with their additional feedbacks and concerns.

CHAPTER V
CONCLUTION

This chapter presents a summary of the research findings presented in chapter four above. The conclusion drawn from the findings of the study are also presented in this chapter. Besides, the chapter presents suggestions and areas for further study

5.1   FINDING

The main objective of this study is to determine the waiting line management practices the AYA Bank (Bo Aung Kyaw). Although, the study had come across several findings which were not included within the scope of the study, for the purpose of meeting the set objectives, the main findings of the study are presented below from the perspective of the queue variables indicated in the study.

Bo Aung Kyaw branch had five service counters and all counter serve all products and services. During the study all service counter are full swing in service and service staff are mostly more than three years of services. The survey carried out random throughout the bank opening hour. The services staff were rotate the rest hour such as lunch and coffee break to accommodate to open all service counter. Bank do have priority service to old people, disable people and pregnant woman. The measurement process starts from when the customer taken a queue number from machine to arrival time of service counter. The door woman or door man will guide to any customer apart from priority person to queue machine and explain what is the next step. All the customer sit at proper waiting area which facing the service counter with comfortable chair. Bank provide coffee machine, cup noodle, newspaper and magazine to accommodate value added service to its customer. From the waiting area customer can be seen clearly which counter was called their queue number. Visual and audio system were announced the service queue number from each counter. All the bank opening days were not much difference the customer arrival rate. The peak hour were lunch break, Monday opening and Friday near closing hour. But the bank service personnel were effective enough to clear with incredible speed and efficiency with huge smile on their face. All bank staff including security personnel were carried out professionally all the services all the times.

Sometimes they do make extra ordinary service such as make coffee for young kids and helpful to old age people. Sometimes they do help to carry the large cash amount to transport customer vehicle or taxi.

By the analysis it is concluded that as the service level are at optimal service level. The waiting time of the customer is efficient. The service efficiency and the customer satisfaction well control and maintain all the period. They do carry out investigation to close one service channel but the result are not much different and service rate remain acceptable level. By the evaluation it is proved that this optimal model of the queuing is feasible.

The AYA bank is heavily invest in staff training development all the time .Due to this continuous training and development, all the staff are effectively to serve , all types of customer. Most inline manager and above are working this AYA since the company set up time. It shown, the employee loyalty and staff turnover rate is very low. They can work well any types of customer and they know well about all their bank system well. Bo Aung Kyaw Branch is located at the heart of the Yangon. All customer are quiet demanding due to business person or small and medium enterprise owner. The cash flow in and out of this branch are very huge, due to most are car dealer, property agent and export import business owner. This branch located at the strategist business location to serve demanding customer and AYA place all their experience staff to this branch may be possible as well. This mean AYA planner knows what to expect and how to deal with it. This branch service quality needs to be all the time fast and efficient. As well as this AYA branch need to maintain this kind of service quality all the time is utmost necessary. Banking service is customer centric and customer satisfaction is the top priority.

5.2   Recommendation

According to the finding, the service channel five or four, do not affect the customer waiting time. It may be a lot of contribution factor that the result is not much difference significantly. Most customer are cash in, cash out may be possible rather than other services which takes more time to serve. Another factor may be all are experience staff to deal with all kinds of customer. The AYA planner place all top tier employee to place at this branch to accommodate the unique customer contribute the waiting time to

fast and efficient. Without this information we could not able to answer the paradox to close one channel or not! But customer waiting area is small and some are standing and waiting for their turn. It impacts some customer to turn away before taking queue number. Another is the car parking lot and sometimes customer violate the traffic rules and bank security are unable to influence them as well. The bank employee needs to be rotate to this branch is necessary to prevent employee burn out. There is no priority channel and bank end service staff to replace with service channel staff to support their rest hour and it not sure what will affect to back end job activity are largely unknown as well. In such, my recommendation to open up one channel to support priority channel to serve priority customer or serve any customer at the peak hour or peak day and switch to any channel when employee need a break time. This can't be measure with theory due to complication.

As mention before that this branch is critical and need to be effective all the time is necessary. As a fast speed changing world, and fast social network, the good service can be wide spread easily as well as negative impact. In such any business model need to be thoroughly study and implement with extra caution to avoid negative business impact.

5.3   Need for further Study

This study only conducts at one critical branch only. For waiting line to understand as a whole need to study all the branches not Yangon but also other branch on all over Myanmar is necessary. The study should include service employee attitude and experience are also need to study as well. Waiting line study should include, duration of the service on different products also necessary. From there, AYA can be set national waiting standard and understand well on their employee serv ice standard as well. In such AYA can set national service standard. But the limitation is some branch is need to such more customer on same peak hour due to location contribution factor. In this argument branch itself need to evaluate the service tier quality and need to formulate the niche market strategy. In such the require survey need to be in line with future set business model is necessary.
