Abstract

Most applications today are using web service to collaborate each other, e.g., weather reports, credit checks, stock quotations, or currency exchange. Web service provides a standard means of interoperating between different applications, running on a variety of platforms and/or frameworks [6]. This thesis focus study on web services efficiency by implementing car ticketing system using web service technology as a case study thus multiple car ticket services become an integrated form to communicate between users and transportation business centers. The system is developed using C# programming language of Microsoft Dot Net Framework.
