## Session VI: Engineering Physics

- Three-Body Cluster Structure of  $^7\text{Li}$  Hypernucleus 126-131  
Theingi and Khin Swe Myint
- Detection of a Single-  $\Lambda$  Hypernucleus by  $K$  Meson Interaction with Nuclear Emulsion 132-136  
Htaik Nandar Kyaw and Thida Wint
- Experimental Design of Fan-beam Gamma Computed Tomography based on Single-source and Single-detector Scanning System for Industrial Application 137-141  
Saw Nyl Nyl Zaw, Myo Zaw Htut, Than Tun Aung, Khaing Nyunt Myaing and Kyaw Lin Oo
- Investigation of Range-Energy Relation in Nuclear Emulsions 142-145  
Mar Mar Htay and Khin Swe Myint
- Relativistic Ground State Energy of Deeply Bound Kaonic Nuclear System  $K^- - ^{208}\text{Pb}$  146-150  
Thida Wint, Kyi Kyi Win and Khin Swe Myint
- Theoretical Analysis of  $\Lambda$ -Triton Bound State using One-Range And Two-Range Gaussian Potentials 151-156  
Kyaw Kyaw Naing
- Applications of Monte Carlo Simulation MCNP for Gamma Computed Tomography CT Scanning 157-162  
Kyaw Lin Oo, Khaing Nyunt Myaing, Zin Bo Oo, Myo Zaw Htut and Kyaw Htay Naing

## Session VII: Engineering Chemistry

- Isolation and Identification of Xanthone from the Root of *Mesua ferrea* L. (Gangaw) 163-168  
Chaw Theingi Khin
- Analysis of Physical and Chemical Properties of Soil Samples from Nyungouk Village in Ma-Hlaing Township (Mandalay Region) 169-173  
Myo Thida Chit and Htay Htay Myint
- Effect of Synthetic Naphthalene acetic acid (NAA) on Rooting Growth and Stem Growth of Cow pea (*Vigna catjang walp*) 174-179  
Khin Mooh Theint and Tin Myint Htwe
- Investigation of Water Quality from Selected Areas in Mandalay Region 180-184  
Thidar Khaing, Htun Htun Naing and Khin Htay Win
- Study on the Total Flavonoid and Tannin Contents of Stem Bark of *Morus alba* L. (Po-sa) and Its Radical Scavenging Activity 185-190  
Aunt Win, Aye Mon Thida Nyo and Kay Thi Win
- Extraction, Characterizations and Application of Pectin from Fruit Peels of *Holocereus undatus* (Haworth) Britton & Rose 191-196  
Aye Mon Thida Nyo, Mar Pi Myint and Yu Mon Aung
- Decolorizing Activity of Corncoobs Powder for Aqueous Solution of Dyes 197-202  
Ni Ni Pe, Thida Khaing and Lwin Mu Aung
- Production and Characterization of Activated Carbon from Banana Empty Fruit Bunch and *Delonix regia* Fruit Pod 203-207  
Htat Htay Myint, Myo Thida Chit and Than Ktike

Table 1. Ranges and Emission Angles of the Tracks [2].

	Track	Range ( $\mu\text{m}$ )	$\theta$ (degree)	$\Phi$ (degree)
Point A	#1	19.1 $\pm$ 0.4	113 $\pm$ 7	262 $\pm$ 7
	#2	5.2 $\pm$ 0.5	66 $\pm$ 7	97 $\pm$ 8
	#3	23.0 $\pm$ 0.4	66 $\pm$ 3	78 $\pm$ 2
Point B	#4	12517	87.14 $\pm$ 1.2	48.19 $\pm$ 1.2
	#5	286 $\pm$ 4	150 $\pm$ 1.0	153.1 $\pm$ 1.2
	#6	7.7 $\pm$ 0.6	40 $\pm$ 4	265 $\pm$ 4
Point C	#7	>14884	55 $\pm$ 1.5	257.1 $\pm$ 0.7
	#8	8.8 $\pm$ 0.4	77 $\pm$ 5	81 $\pm$ 3

## 2. Formulation of Range and Energy Relation

We consider collision between charged particles of mass  $M_1$ , charge  $ze$ , and the velocity  $v_1$  approach a stationary particle of mass  $M_2$  and charge  $Ze$ . If the force between particles at distance  $r$  is given by the law of inverse square.

$$F = \frac{zZe^2}{4\pi\epsilon_0 r^2} \quad (1)$$

The impulse due to the Coulomb force is

$$\int \frac{zZe^2}{4\pi\epsilon_0 r^2} \cos \psi dt = \int \frac{zZe^2}{4\pi\epsilon_0 r^2} \cos \psi \frac{ds}{v} \quad (2)$$

By substituting equation (1) in equation (2) and we obtain,

$$\Delta q = \frac{zZe^2}{4\pi\epsilon_0} \int_{-\frac{\theta}{2}}^{+\frac{\theta}{2}} \frac{\cos \psi d\psi}{pv_1} \quad (4)$$

$$\Delta q = \frac{zZe^2}{2\pi\epsilon_0 pv_1} \cos \frac{\theta}{2} \quad (5)$$

According to equation (5),

$$2M_1 v_1 \sin \frac{\theta}{2} = \frac{zZe^2}{2\pi\epsilon_0 pv_1} \cos \frac{\theta}{2} \quad (6)$$

and then, obtained the impact parameter as

$$p = \frac{zZe^2}{4\pi\epsilon_0 M_1 v_1^2} \frac{\cos \frac{\theta}{2}}{\sin \frac{\theta}{2}} \quad (7)$$

$$p = \frac{b}{2} \cot \frac{\theta}{2} \quad (8)$$

where,  $b = \frac{zZe^2}{2\pi\epsilon_0 M_1 v_1^2}$   $b$  is the collision diameter.

The corresponding energy loss of the incident heavy particle is

$$Q = \frac{1}{2} \frac{(\Delta q)^2}{m} = \frac{z^2 e^4}{8\pi^2 \epsilon_0^2 m v^2} \quad (9)$$

As the heavy particle passes through a thickness of absorber in which there are  $N$  atoms of atomic number  $Z$  per  $m^3$  the number of collisions transferring energy between  $Q$  and  $Q + \delta Q$  is the number of electrons within

the annulus of area  $2\pi r dr$  transferred, for all impact parameters.

$$dT = 2\pi NZ dx \int_0^{\infty} Q p dp$$

$$\frac{dT}{dx} = \frac{NZ}{4\pi\epsilon_0^2} \frac{z^2 e^4}{m v^2} \log \frac{P_{max}}{P_{min}}$$

For  $P_{min}=0$ , the energy loss becomes infinite

Where  $m$  is the electron mass and  $Q_0$  is the maximum energy transferred which can be seen

$$Q_0 = 2mv^2 = \frac{4m}{M} T$$

with  $T = \frac{1}{2} Mv^2$  the initial kinetic energy of the heavy particle.

$$dT = \pi NZ dx Q_0 \frac{b^2}{4} \log \frac{P_{max}^2 + \frac{b^2}{4}}{P_{min}^2 + \frac{b^2}{4}}$$

$$\text{Here, } Q_0 = 2mv^2 \text{ and } b = \frac{z^2 e^2}{2\pi\epsilon_0 m v^2}$$

The stopping power of charged particle by matter is as follow. The stopping power is defined as the energy lost by the particle per unit path in the substance. The theory of the stopping power depends on knowledge of the behavior of electrons in atoms. If the range is known as the function of energy, the stopping power can be written as,

$$\frac{dT}{dx} = NZ \frac{z^2 e^4}{8\pi\epsilon_0^2 m v^2} \log \frac{P_{max}^2 + \frac{b^2}{4}}{P_{min}^2 + \frac{b^2}{4}} \quad (10)$$

In this  $P_{min}$  may be set equal to 0, corresponding to the energy transfer  $Q_0$ . We thus put  $P_{min} = 0$

Assuming that  $P_{max} \gg b/2$ , the stopping power limit becomes

$$\frac{dT}{dx} = \frac{NZ}{8\pi\epsilon_0^2} \frac{z^2 e^4}{m v^2} \log \frac{4P_{max}^2}{b^2} \quad (11)$$

To a good approximation,

$$\frac{dT}{dx} = \frac{z^2 e^4}{4\pi\epsilon_0^2 m v^2} NZ \log \frac{2m v^2}{I} \quad (12)$$

$$\text{where, } I = \frac{z\pi e^2}{2\pi\epsilon_0 v}$$

Finally, we obtained the stopping power as shown equation (16).

The range of a heavy charged particle is equal to its path length in matter because the scattering is negligible. The stopping power varies with the mass of particle, and the range of the particle is given by

$$R = \int_0^T \frac{dT}{dT/dx}$$

## Investigation of Range-Energy Relation In Nuclear Emulsions

### Abstract

We calculated the kinetic energies of various particles for different tracks in nuclear emulsion from range-energy relation derived from a simplified model. In our research work, firstly we studied collision between charged particles, energy loss by collision, stopping power and range-energy relation. This relation consists of the number of atoms, the average atomic number and the density of emulsion plate. We solved numerically the range-energy formulation to obtain the kinetic energy of particles for various tracks in emulsion plates. The kinetic energies of particles which decay in emulsion from Fuji ET 7D emulsion plates used in E373 experiment for five tracks were determined from range-energy relation. Our result values for various particles, namely,  $p$ ,  $d$ ,  $t$ ,  $^3\text{He}$ ,  $^4\text{He}$ ,  $^3\text{H}$ ,  $^4\text{H}$ ,  $^4\text{He}$ ,  $^5\text{He}$  and  $^6\text{He}$  are compared with above experimental data of Lambda hypernuclei in nuclear emulsion. It is found that there are some discrepancies between the results which is mainly due to simplification imposed in our formalism.

**Keywords:** range, energy, nuclear emulsion, hyper nuclei

### 1. Introduction

An emulsion stack consisted of eleven or twelve plates with  $24.5 \times 25.0$  -  $\text{cm}^2$  area. Since the most upstream plate was used to connect  $\Xi^-$  hyperon tracks from the SciFi-Bundle detector, it was necessary to minimize the distortion of the emulsion gel of the plate. For this reason, a thin emulsion plate was located upstream followed by ten or eleven thick emulsion plates [1]. The thin plate had 70- $\mu\text{m}$ -thick or 100- $\mu\text{m}$ -thick emulsion gel on both sides of a 200- $\mu\text{m}$ -thick plastic base film, and each thick plate had 500- $\mu\text{m}$ -thick emulsion gel on both sides of a 40- $\mu\text{m}$ -thick or 50- $\mu\text{m}$ -thick plastic film.

All emulsion plates were prepared in Gifu University with the following procedure. First emulsion gel was poured to one side of the plastic film. They were dried in a drying cabinet which moved emulsion plates automatically so that they were dried uniformly. After drying the emulsion gel, gel was poured to the other side of the plates and dried in the same manner. Then, the emulsion plates were dried again with lower humidity. Each of the emulsion plates

was divided to four plates with the size of  $24.5 \times 25.0\text{cm}^2$ .

(a) Top view

(b) Side view

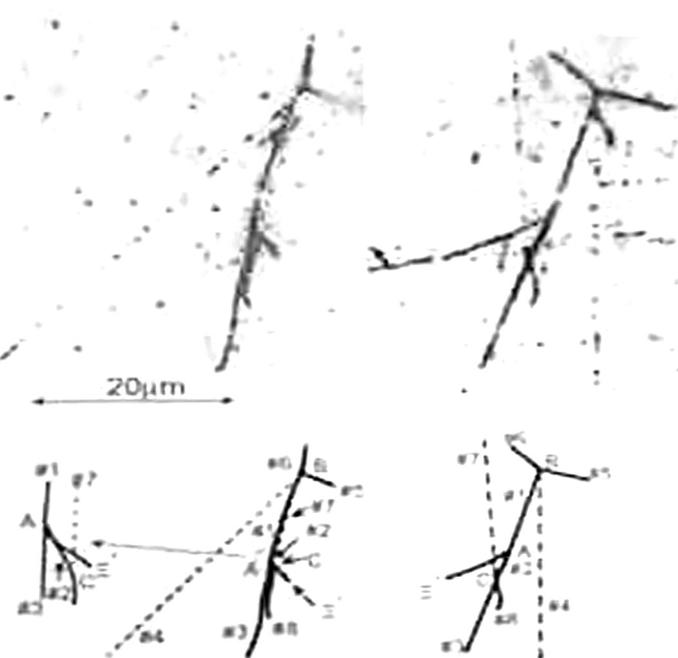

Figure 1. Picture and Schematic Drawing of the Event Viewed from the Vertical (a) and the Horizontal (b) Direction [2].

Figure 1. shows a picture and a schematic drawing of the event from E373 experiment [2]. The purpose of this experiment is to study double-strangeness nuclei produced via  $\Xi^-$  hyperon capture at rest. The  $\Xi^-$  was captured by a nucleus at point A. Three charged particles (track #1, #2, #3) were emitted from point A. Track #1 shows the topology of a decay into three charged particles at point B. Track #2 also shows a topology of decay into two charged particles at point C.

Table (1) summarizes the ranges and the emission angle of these tracks. The ranges were measured prior to swelling the emulsion. A package "SRIM 2000" [3,4,5] was used to calculate a kinetic energy from a range. The density of the emulsion of this plate was determined as  $3.5 \pm 0.07\text{g/cm}^3$  deduced from the measurement of the weight and volume of the emulsion plates. The two ranges at two different energies well with the range-energy relation calculated with SRIM2000.

The range may formally be obtained by integration of the expression for energy loss and the log term is neglected.

$$R = \int \frac{8\pi z^2 m}{r^2 e^4 NZM} T dt \quad (18)$$

We obtained range and energy relation as the following equation.

$$R = \frac{4\pi z^2 m}{r^2 e^4 NZM} T^2 \quad (19)$$

We also calculated range-energy relation by including log term as follow.

$$R = \frac{4\pi z^2 m}{r^2 e^4 NZ} \frac{1}{\log(2\pi N T^2 / 1)} dt \quad (20)$$

$$R = \frac{8\pi z^2 m}{r^2 e^4 NZM} \int \frac{T}{\log\left(\frac{4\pi T}{M}\right)} dt \quad (21)$$

This formulation consists of the number of atoms, the average atomic number and the density of emulsion plate. The density of Fuji ET 7D emulsion is  $3.55 \times 10^{-39} \text{ g/fm}^3$ . This formulation consists of the number of atoms, the average atomic number and the density of emulsion plate. The density of Fuji ET 7D emulsion is  $3.55 \times 10^{-39} \text{ g/fm}^3$ . Table (2) shows the composition of the Fuji ET-7C and ET-7D emulsion [6]. We calculated the total atoms and average mass number of Fuji ET 7D emulsion. The average atomic number of emulsion is obtained 34.553 by summing the atomic number of each element by considering the weight ratio in emulsion plate. The total atoms of emulsion plate is obtained from Avogadro's law.

The lengths of tracks (Ranges) are used in E-373 experiment [2]. We solved numerically equation (19) and (21) by using FORTRAN code to obtain the kinetic energies of various particles for various ranges in emulsion plate.

Table 2. The Composition of the Fuji ET-7C and ET-7D Emulsion [6].

material	weight ratio(%)	mol ratio(%)
I	0.3	0.06
Ag	45.4	11.2
Br	33.4	11.1
S	0.2	0.2
O	6.8	11.3
N	3.1	5.9
C	9.3	20.6
H	1.5	40.0

## 2. Results and Discussion

We calculated the average atomic number (Z) and the total number of atoms of emulsion plate by considering the weight ratio of each element in the emulsion. The density of Fuji ET 7D emulsion is  $3.55$

$\times 10^{-39} \text{ g/fm}^3$ . The lengths of tracks which we used in emulsion plate from E-373 experiment [2]. We solved numerically equation (19) and (21) to obtain the kinetic energies of various particles by using the simplified model. The results are shown in tables (3), (4) and (5).

Ichikawa et. al calculated the kinetic energies of possible particles for various tracks from range-energy relation which contains emission angle of the tracks ( $\theta$  and  $\phi$ ) by using a package SRIM 2000 [2]. Their acceptable particles are  $^4\text{He}$  for track #6 and #3, proton for track #5 and  $^3\text{He}$  for track #1 and #2. They assumed that  $\Xi$  hyperon was absorbed by light nucleus  $^{14}\text{N}$  in the emulsion. Their results are shown in the following tables.

We calculated the kinetic energies of possible particles (p, d, t,  $^3\text{He}$ ,  $^4\text{He}$ ) for three tracks(track #6, #3,#5). The results are shown in table (3) and (4). It is seen that our results which neglect log term, agree fairly with the results of Ichikawa et. al [2] for short range but do not agree for long range. Our results which contain log term agree fairly with the results of Ichikawa et. al [2] for long range but do not agree for short range. Our calculated kinetic energy of acceptable particle ( $^4\text{He}$ ) for track #6 and #3 which neglect log term, agree with the results of Ichikawa et. al [2].

The kinetic energies of hyper-nuclei ( $^3\text{H}$ ,  $^4\text{H}$ ,  $^4\text{He}$ ,  $^5\text{He}$ ,  $^6\text{He}$ ) for track #1 and #2 were calculated from equation (19) and (21). The results are shown in table (5). It is observed that our result is in better agreement with those of Ichikawa et. al [2] for the longer the tracks. Our result which contains log term for  $^3\text{He}$  is in agreement with those of Ichikawa et. al [2] for track #1 and #2. This particle is acceptable particle.

Table 3. Various Kinetic Energies of Possible Particles for Track #6 (7.7  $\mu\text{m}$ ), Track #3 (23  $\mu\text{m}$ ) with our Results A, B and Ref [2].

Particles	Kinetic energy (MeV)			Kinetic energy (MeV)		
	A	B	track #6 [2]	A	B	track #3 [2]
p	0.610	0.550	0.67	1.029	1.168	1.29
d	0.801	0.670	0.79	1.455	1.272	1.74
t	0.981	2.468	0.84	1.781	3.080	1.96
$^3\text{He}$	2.122	1.585	2.2	3.563	1.899	4.80
$^4\text{He}$	2.350	1.645	2.3	4.104	4.280	3.33

Table 4. Various Kinetic Energies of Possible Particles for Track #5(286  $\mu\text{m}$ ) with our Results A, B and Ref [2].

Particle	Kinetic energy (MeV)		
	A	B	track #5
p	1.625	6.150	6.62
d	0.120	1.945	8.7
t	6.272	8.997	10.2
$^3\text{He}$	17.543	21.790	23.5
$^4\text{He}$	14.851	24.333	26.4

Table 5. Various Kinetic Energies of Possible Particles for Track #7 (5.2  $\mu\text{m}$ ) and by Track #1 (19.1  $\mu\text{m}$ ) with our Results A, B and Ref [2].

Particle	Kinetic energy (MeV)			Kinetic energy (MeV)		
	(A)	(B)	Track #7 [2]	(A)	(B)	Track #1 [2]
$^1_1\text{H}$	0.824	0.390	0.58	1.078	0.643	1.75
$^2_1\text{H}$	0.943	0.823	0.56	1.882	1.633	1.88
$^3_2\text{He}$	1.887	2.130	1.6	3.843	4.500	4.73
$^4_2\text{He}$	2.096	1.623	1.6	4.270	4.900	4.98
$^6_3\text{Li}$	2.290	1.888	1.6	4.666	4.680	5.18

#### 4. Conclusion

We calculated the kinetic energies of various particles (p, d, t,  $^3\text{He}$ ,  $^4\text{He}$ ,  $^1_1\text{H}$ ,  $^2_1\text{H}$ ,  $^3_2\text{He}$ ,  $^4_2\text{He}$ ,  $^6_3\text{Li}$ ) for various tracks from range-energy relation by using a simplified model. Ichikawa et. al calculated the kinetic energies of various particles (p, d, t,  $^3\text{He}$ ,  $^4\text{He}$ ,  $^1_1\text{H}$ ,  $^2_1\text{H}$ ,  $^3_2\text{He}$ ,  $^4_2\text{He}$ ,  $^6_3\text{Li}$ ) whose tracks are found in Fuji ET 7D emulsion from E373 experiment [2]. They obtained the kinetic energy of various particles by using a package "SRIM 2009". They assumed that target as  $^7\text{N}$  which absorbed  $\Xi^-$  at rest and they take the emission angles ( $\theta, \phi$ ) which are shown in table (1.1).

We calculated the kinetic energies of various particles (p, d, t,  $^3\text{He}$ ,  $^4\text{He}$ ). It is observed that our calculated results which neglect log term, agree fairly with the results of Ichikawa et. al [2] for short range but do not agree for long range. Our calculated results which contain log term, agree fairly with the results of Ichikawa et. al [2] for long range but do not agree for short range.

We also calculated the kinetic energies of various nuclei ( $^3\text{H}$ ,  $^4\text{H}$ ,  $^3\text{He}$ ,  $^4\text{He}$ ,  $^6\text{Li}$ ,  $^7\text{Li}$ ). Our result is in better agreement with the results of Ichikawa et. al [2] for the longer the tracks, but there are some discrepancies between the results which is mainly due to assumptions employed in the formalism. The assumptions made in our model are as follows, (i) collision is a forward direction ( $\theta = 0$ ) (ii)  $P_{\text{min}} \gg b/2$ , where  $P_{\text{min}}$  = impact parameter,  $b$  = collision diameter (iii)  $1 = kZ$ , where  $k = 1/4\epsilon_0$  is deduced from experimental results (iv) the atomic number and mass number of target is the same atomic number and mass number emulsion plate.
