ABSTRACT

This study focuses on the factors identifying the entrepreneurial ecosystem through the Myanmar Young Entrepreneurs Association (MYEA) whose members are entrepreneurs in different areas and from diversified backgrounds. The main objectives of the study are to explore the demographic and socioeconomic information of Myanmar's entrepreneurs and to identify the factors that affect the success of businesses with an entrepreneurial orientation, with a special focus on young entrepreneurs. Primary data is collected from a random sample of 260 entrepreneurs who are business owners and top management, as well as the members of MYEA. Data collection is done with the permission of the Management Committee of Myanmar Entrepreneurs Association members living throughout Myanmar via online survey mode on their mobile phones in order to reach a wider audience. The secondary data is collected from relevant textbooks, SME associations, previously prepared research papers, and internet websites. The descriptive statistics, factor analysis, and MAP test were used in the study. According to the results, the four main pillars of a unified and systematic ecosystem are the Support and Network Pillar, Human and Culture Pillar, Market and Technology Pillar, and Financial Pillar. Entrepreneurs may apply these identifying factors by strengthening their new ventures to make their entrepreneurial endeavors more successful and long-lasting.

ACKNOWLEDGEMENTS

Initially, I would like to thank Professor Dr. Tin Tin Htwe, Rector of Yangon University of Economics, for giving me permission to finish this thesis.

I would like to express my sincere gratitude to Professor Dr. Mya Thandar, Pro-Rector, Yangon University of Economics for her helpful advices and valuable suggestions to improve this thesis.

I would like to express my heartiest gratitude to Professor Dr. Maw Maw Khin, Pro-Rector, Meiktila University of Economics, Former Program Director of MAS Program for the concern and encouragement to the participants of MAS Program.

Moreover, I also would like to express my special thanks to Professor Dr. Nyunt Nyunt Win, Head of Department of Statistics, Yangon University of Economics for giving me the chance to finish this thesis.

Furthermore, I would like to express my heartfelt thanks to other examiners, Daw Khin Moh Moh, Lecturer (Retired), Department of Statistics, Yangon University of Economics and Dr. Hlaing Hlaing Moe, Professor, Department of Statistics, Yangon University of Economics for providing the data and all the information needed in this study.

And, I am highly indebted to my supervisor, Daw Aye Aye Maw, Associate Professor (Retired), Department of Statistics, Yangon University of Economics for her valuable advice, guidance, patience, kindness, assistance and support during the preparation and writing thesis.

In Addition, I'm profoundly grateful to all the Professors, Associate Professors and Lecturers of the Department of Statistics for a great variety of knowledge and concepts of applied statistics during the study period of Master of Applied Statistics (MAS) Program.

My special thanks go to the President, Management Committee and all Entrepreneurs from Myanmar Young Entrepreneurs Association (MYEA) for their kind support for providing the data and all the information needed in this study.

Finally, I am grateful to my parents, family and my friends from MAS for their continuous support and patience throughout the course of my study.

CHAPTER I

INTRODUCTION

The essence of an entrepreneurial ecosystem is its people and the culture of trust and collaboration that allows them to interact successfully. An ecosystem that allows for the fast flow of talent, information, and resources helps entrepreneurs quickly find what they need at each stage of growth. To realize growth and innovation, the ecosystem must function well for entrepreneurs. Such an “entrepreneurial ecosystem” is an interactive network of actors who influence each other and the chances of survival of a venture creator and his company in a region or country. Entrepreneurs boost economic growth by introducing innovative technologies, products, and services. Increased competition from entrepreneurs challenges existing firms to become more competitive. Entrepreneurs provide new job opportunities in the short and long term.

1.1 Rationale of the Study

Entrepreneurs are those who can perform the best to deliver on the country’s goals of better productivity, prosperity, and inclusion. They create new job opportunities, stimulate innovation, and even provide goods and services more effectively and efficiently. Nowadays, new enterprises are forming broadly, and entrepreneurs are emerging in all sectors and regions in Myanmar. Emerging businesses less than 10 years old are creating a vast number of new jobs in many countries and they can do so in Myanmar as well. Myanmar's entrepreneurs can be an accelerator of growth for the country.

Since a few years ago, the term “entrepreneurship” has become gradually popular in the context of small and medium sized enterprises (SMEs) in Myanmar. Many people all over the world have broadly focused on the differentiation between SME and entrepreneurship, but Myanmar still has less reference in this aspect.

This survey is dedicated to the Myanmar entrepreneurs who have been courageous, taken risks, and invested their resources, time, and full effort on many occasions in building up Myanmar better, contributing to in policy dialogue with the government and mentoring upcoming entrepreneurs. The survey consulted in-depth with entrepreneurs in many industries and regions under the Myanmar Young Entrepreneurs Association (MYEA).

Moreover, just establishing an entrepreneurial orientation strategy within a company would not guarantee a successful company's future unless knowing the Entrepreneurship Ecosystem. Building up a strong Entrepreneurship Ecosystem generally has six main pillars: access to market, access to finance, access to technology, building human capacity, setting policy and entrepreneurship culture.

Without understanding the following aspects, Myanmar's entrepreneurial development cannot be built up successfully. Understanding Myanmar Entrepreneurs, factors that have positively influenced the success of entrepreneurial businesses in Myanmar, the support of contributors and collaborators, which are key players in the development of Entrepreneurship in Myanmar. This study analyzed the factors identifying the Myanmar entrepreneurship ecosystem is critical in order to capitalize on the ecosystem's development.

1.2 Objectives of the Study

The main objectives of the study are:

- i. To explore the demographic and socio-economic characteristics of the Myanmar Entrepreneurs and
- ii. To identify factors which influence entrepreneurship ecosystem in Myanmar.

1.3 Methods of Study

Descriptive statistics was taken in order to understand the demographic and socio-economic characteristics of Myanmar's entrepreneurship. A factor analysis was employed to study the identified factors in the Myanmar entrepreneurship ecosystem. Both primary and secondary data were used in this study. For secondary data, this study was based on information from internet websites, the data from the Myanmar Young Entrepreneurs Association, relevant published books, related research papers, and theses. The required primary data was collected by using a simple random sampling method. A structured questionnaire was used to collect primary data.

1.4 The Scope and Limitations of the Study

This study was focused only on identifying the factors of the Myanmar entrepreneurship ecosystem at the time of the survey. In its early stages of entrepreneurship, Myanmar has a very limited source of entrepreneurs, which can be differentiated from the Small and Medium Enterprises (SME). The primary data was

taken from the Myanmar Young Entrepreneurs Association (MYEA), which has 779 active members at the time of the survey in 2019. In this study, a simple random sample of 260 respondents was selected from 779 active members and data collection was done via online survey.

1.5 The Organization of the Study

The study is formally organized with Five Chapters. In chapter one, the introduction, rationale of the study, method of study, scope and limitations of the study and organization of the study are described. Chapter Two presents an overview of the Entrepreneurship Ecosystem among Entrepreneurs in Developing Countries. Research methodology is mentioned in chapter three. In chapter four, the results and findings are described. Chapter five concludes the findings concerned with the Myanmar Entrepreneurship Ecosystem, and then suggestions and recommendations were also prescribed.

CHAPTER II

OVERVIEW OF ENTREPRENEURSHIP ECOSYSTEM

This chapter presents the definition of entrepreneurship, entrepreneurship ecosystem, entrepreneurship ecosystem among entrepreneurs in developing countries, Myanmar entrepreneurship, Myanmar young entrepreneurs association and literature review of entrepreneurship ecosystem.

2.1 Definition of Entrepreneurship

Entrepreneurs are people who innovate in commercially or socially useful ways who create new businesses and projects by launching new products, services, and processes. They are the keen to adopt new technologies, new business models and find new ways to fulfill unmet needs or create better value for society. Most entrepreneurs are young and are founders of their first enterprises though there are some serial entrepreneurs. In many countries, they are in their thirties or forties and have gained valuable experience working for others, or they are innovating in new areas from their own business base.

There are many definitions of entrepreneurship. Among them, Christopher S. Hayter's definition is: "Knowledge-based Entrepreneurship is a process of application and customization of a combination of domain, market, industry-specified, area, and cultural knowledge to affect economically prudent and sustainable business ventures" (Hayter, 2013).

Entrepreneurs tend to launch products, services, and processes that are original or adapted from ones that they have seen elsewhere. Sometimes, they start entirely new industries. They introduce new technologies and try new business processes. They market in novel and creative ways. Entrepreneurs are good at both identifying needs that are not being met and meeting those needs.

Entrepreneurs focus on innovation and growth, which generates higher incomes for people and creates jobs. Entrepreneurs are demonstrably contributing to government objectives for job creation. Entrepreneurs boost productivity in all sectors of the economy, including agriculture. Entrepreneurial businesses include not only those in the information technology (IT) sector, but also those in agriculture and agribusiness,

transportation and logistics, health care, education, food processing, wholesale and retail trade, tourism, business services, and consumer services.

2.2 Entrepreneurship Ecosystem

An entrepreneurial ecosystem or entrepreneurship ecosystems are peculiar systems of interdependent actors and relations directly or indirectly supporting the creation and growth of new ventures. An entrepreneurship ecosystem includes actors such as entrepreneurs, firms, angel investors, venture capital companies, banks, nongovernmental organizations (NGOs) and civil society organizations, universities, government agencies, trainers, researchers, and others that help inform, support, and monitor the state of entrepreneurs in a given country, city, or locality.

The ecosystem's performance is measured by tracking the number of startups, the number of high-growth firms, the levels of high-impact entrepreneurs, the number of serial entrepreneurs, data on the aspirational values of young people, and investments in the entrepreneurship sector. The key elements or pillars in an ecosystem combine into a unified, systematic ecosystem; they should neither be viewed as being implemented sequentially nor as any one being more important than any other. They are not independent of each other—improvements in one pillar will often lead to improvements in others, while weaknesses in one pillar can make conditions more difficult in other pillars. Strengthening an entrepreneurial ecosystem can be a decade-long process, so it is important to calibrate expectations and champion broad support.

There are different types of ecosystems such as Startup ecosystem and University-based entrepreneurship ecosystem:

Startup ecosystem - following the financial downturn of 2008 and the long-lasting slow growth period, there have been increasing focus towards fostering more startup company creation around the world to further target regional support efforts towards those type of companies that have higher innovation, growth and job creation potential. This has also led to an increasing focus on startup ecosystem development.

University-based entrepreneurship ecosystem – Entrepreneurship thrives in ecosystems in which multiple stakeholders play key roles. Academic institutions are central in shaping young people's attitudes, skills and behaviors. However, actors outside of the education systems play an increasingly critical role in working with formal and informal educational programs as well as reaching out to underserved and

socially excluded targets groups. This requires collaboration and multistakeholder partnerships. Entrepreneurship ecosystems commonly refer to academic programs within a university that focus on the development of student/graduate entrepreneurs and/or the commercialization of technology or intellectual property developed at the university level. However, before the entrepreneurial ecosystem can bloom, the education system must embrace the idea that entrepreneurship is a core element of higher education.

2.3 Entrepreneurship Ecosystem among Entrepreneurs in Developing Countries

Entrepreneurs create solutions for some of society's most difficult development challenges. They create new and effective approaches to many different sectors like education, health, daycare, and waste management. Some form social enterprises to deliver these services. Other countries have reaped significant benefits from these entrepreneurial solutions, which, when properly licensed and supervised, can decrease government spending budgets and human resource costs.

Entrepreneurs take their own responsibility and do not expect special favors, protection, or subsidies much from others. They value fair play and not be unduly hampered as they go about creating value for the country. They know that prosperity rests on the shoulders of the productive sectors. They believe in being legally incorporated. They also excel at observing how things are being done in other countries and bringing ideas back home countries. Myanmar desperately needs these skills and approaches to catch up with other ASEAN (Association of Southeast Asian Nations) countries and the rest of the world in terms of inclusive and sustainable economic growth. Table (2.1) presents a qualitative ranking in the Entrepreneurship white paper of Myanmar Young Entrepreneurs Association on the quality of Myanmar's entrepreneurship ecosystem relative to its neighboring countries in 2016. The ranking based on the Likert scale from 0 to 5.

Table (2.1) Quality of Entrepreneurship Ecosystems by Pillar

| Country | Access to Markets | Access to Finance | Human Capacity | Supports/ Networks | Culture of Entrepreneurship | Entrepreneurship Policy |
|----------------|--------------------------|--------------------------|-----------------------|---------------------------|------------------------------------|--------------------------------|
| Myanmar | 1.5 | 1 | 1 | 1.5 | 1 | 1 |
| Cambodia | 1.5 | 2 | 2 | 1.5 | 1 | 2 |
| Laos | 1 | 1.5 | 1.5 | 1 | 1 | 2 |

Notes: 0 = absent; 1 = very weak; 5 = very strong.

2.4 Myanmar Entrepreneurship

According to the referenced white paper published by Myanmar Young Entrepreneurs Association (MYEA) in 2017, entrepreneurs provide benefits for Myanmar. Entrepreneurs currently generate thousands of jobs and plan on continuity to grow. They contribute to Myanmar's economic growth by creating new products, services, and business processes. They enhance productivity and help solve problems. They start new ventures and can lead a country into entirely new industries. In agribusiness, for instance, some are buying, freezing, packaging, and exporting fruits and vegetables, helping to diversify agriculture away from an overreliance on rice whilst others are introducing new processing techniques and working with farmers to grade and export Myanmar's high-value coffee, flavorful mangoes, and much more. An entrepreneurship policy shall benefit all industries and all regions of Myanmar, enhancing truly inclusive growth. They are helping Myanmar catch up to global standards in many industries. Entrepreneurs create the basis for a socially responsible society marked by inclusive growth. As entrepreneurs grow, they help ensure that a stable middle class will develop to contribute to political stability and sustained economic growth.

Myanmar is emerging from decades of political and economic stagnation—a system that encouraged privilege for the few and made it difficult for the vast majority to prosper and grow.

Nowadays, a much broader segment of Myanmar’s economy—the men and women who own businesses, buy and sell goods and provide services to their customers, and who look to regional and global markets for inspiration on new processes, products, and markets that can add value to people's lives in Myanmar. Table (2.2) states that the indicative list of ecosystem actor types and organizations in Myanmar as of 2016.

Table (2.2) Indicative List of Ecosystem Actor Types & Organizations

| Type of Ecosystem Actor | Organization |

2.5 Myanmar Young Entrepreneurs Association

In 2008, there was an initiative between ASEAN and China to form the ASEAN China Young Entrepreneurs Forum, where the leading young entrepreneurship associations from ASEAN and China would come together for the development of entrepreneurship in the region. At that time, Myanmar did not have a representative organization to participate in this initiative. Due to this, under the guidance and support of the Union of Myanmar Federation of Chambers of Commerce and Industry, the Myanmar Young Entrepreneurs Group for formed in November 2009.

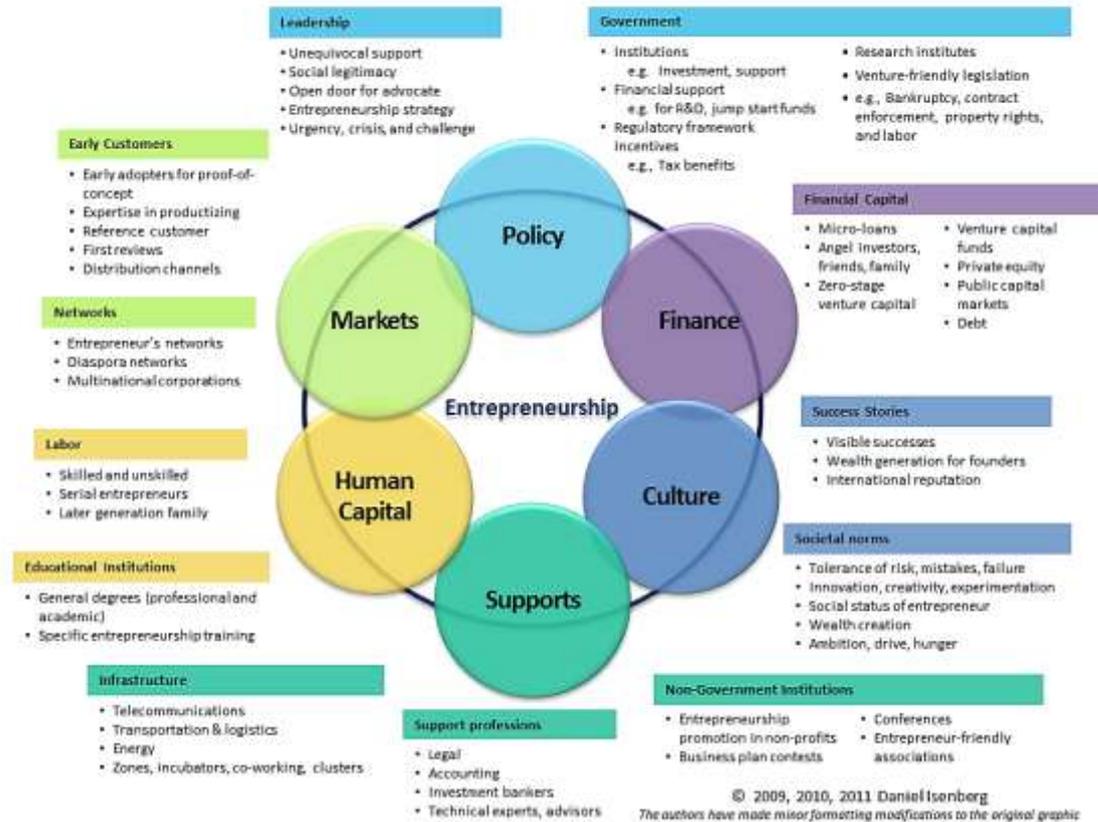

The Group participated actively in local and regional entrepreneurship development events and grew rapidly. In June 29, 2012, the Group was upgraded and became the Myanmar Young Entrepreneurs Association (MYEA). The association is one of the primary architects and founding members of the ASEAN Young Entrepreneurs Council and, in March 2015, it was recognized by the Ministry of National Planning and Economic Development of the Republic of the Union of Myanmar as the Lead Association that will represent Myanmar in the Council. This cemented the association not only as a local but regional player in the entrepreneurship development space.

The main objective of the association is to empower young entrepreneurs and assist in creating a vibrant entrepreneurship ecosystem in Myanmar. The vision of MYEA is “To be the leading, recognized institution for the empowerment of young entrepreneurs” and their mission statement says that “To empower young entrepreneurs and assist in creating a vibrant entrepreneurship ecosystem in Myanmar for national development and inclusive growth and innovation”. As of today, MYEA has organized and participated in numerous events and activities with a variety of organizations both locally as well as internationally. The main activities of MYEA are; Member Days, Seminar and Workshops, Entrepreneurship Development Caravans, Certified Entrepreneurship Capacity Building Programs, Entrepreneurship Assistance Networks and Entrepreneurs Network Parties. MYEA also conducts the Special Projects such as Annual Entrepreneurship Summit and Awards, Incubator/Mentorship Network, Tigers@Mekong Entrepreneurship Boom Camp, RISE Camp for Business Plan Development, Angel Investment Network, Social Entrepreneurship Forum and the like.

Their members include an impressive pool of young entrepreneurs covering all sectors of the industry, with diverse abilities and expertise who are passionate about the growth and development of entrepreneurship in Myanmar and have a culture of a Community of Friends. MYEA stands ready to cooperate with others in the pursuit of growth and development in Myanmar and the region. At the time of this study in 2019, MYEA had 779 active members across the country with balanced ration of gender among in all the members.

2.6 Literature Review of Entrepreneurship Ecosystem

There are a number of models of Entrepreneurial Ecosystem. A widely used framework was developed by Professor Daniel Isenberg, the world's leading global entrepreneurship expert of Babson College in the United States as shown in the Figure (2.1). He identifies six domains within the entrepreneurial system: a conducive culture, enabling policies and leadership, availability of appropriate finance, quality human capital, venture friendly markets for products, and a range of institutional supports. These generic domains comprise hundreds of elements interacting in highly complex and idiosyncratic ways. Identifying generic causal paths is therefore of limited value. He therefore emphasizes the importance of context: each ecosystem emerges under a unique set of conditions and circumstances. The six areas are based on an assessment of global best practices drawn from extensive research among countries that have achieved high levels of entrepreneurship. These six pillars create what Isenberg calls an "entrepreneurship ecosystem," i.e., the environment conducive to the starting and growing of firms. Each pillar has specific proposed activities, time frames, implementing parties, and priorities. He maintains that such an approach constitutes a novel and cost-effective strategy for stimulating economic prosperity. According to Isenberg, this approach potentially replaces or becomes a pre-condition for the successful deployment of cluster strategies, innovation systems, knowledge economy or national competitiveness policies.

Source: Isenberg Model of the Entrepreneurship Ecosystem (Babson College Project 2011)

Figure (2.1) Six Pillars of the Entrepreneurship Ecosystem

The Babson College Entrepreneurship Ecosystem Project categorizes this framework into six domains – policy, finance, culture, supports, human capital and markets. Additional scholarships have reinforced this conceptualization, and Liguori and colleagues created a measure that has been widely used nationally to assess communities.

- *Policy* covers government regulations and support.
- *Finance* domain includes the full spectrum of financial services available to entrepreneurs.
- *Culture* covers societal norms and success stories that help to inspire people to become entrepreneurs.
- *Support* domain includes non-governmental institutions, infrastructure and the professionals support such as investment bankers, technical experts and advisors.
- *Markets* cover entrepreneurial networks and customers.

- *Human capital* includes education system and the skill level of the workforce.

Several academic researchers have begun to investigate entrepreneurial ecosystems as well. Spigel, the author of *The Relational Organization of Entrepreneurial Ecosystems* (2017), suggests that ecosystems require cultural attributes (a culture of entrepreneurship and histories of successful entrepreneurship), social attributes that are accessed through social ties (worker talent, investment capital, social networks, and entrepreneurial mentors) and material attributes grounded in the specific places (government policies, universities, support services, physical infrastructure, and open local markets). Stam who wrote “*Entrepreneurial Ecosystems and Regional Policy* (2015) distinguishes between framework conditions of ecosystems (formal institutions, culture, physical infrastructure, and market demand) with systematic conditions of networks, leadership, finance, talent, knowledge, and support services.

There are various key conditions which define a healthy ecosystem. The ecosystem:

- is tailored around its own unique environment
- operates in an environment with reduced bureaucratic obstacles in which government policies support the unique needs of entrepreneurs and tolerate failed ventures
- actively encourages and invites financiers to participate in new ventures - although access to money isn't without barriers for those planning new business ventures
- is reinforced, not created from scratch, by government, academic or commercial organizations
- is relatively free from, or is able to change the cultural biases against failure or operating a business
- promotes successes, which in turn attract new ventures
- is supported by dialogue among various of the entrepreneurship stakeholders

The white paper titled "Entrepreneurship: Key to Inclusive and Sustainable Growth in Myanmar (2016)" which was done by Myanmar Young Entrepreneurs Association refers to an entrepreneurial policy built on six strategic pillars that create a dynamic ecosystem to enable growth entrepreneurship. This framework is informed by global research and best practices learned from other countries' entrepreneurship initiatives, while remaining closely tied to Myanmar's actual conditions. The entrepreneurship white paper outlines steps to help Myanmar realize that goal. It is affirmed in Myanmar on the basis of more than 100 interviews and an in-depth survey of 260 Myanmar entrepreneurs from many industries and regions in 2016. This widely used framework was developed by Professor Daniel Isenberg of Babson College in the United States. The Organization for Economic Cooperation and Development (OECD), which coordinates policies among the advanced economies, utilizes this framework as well. The MYEA is using this approach as a guide for strengthening entrepreneurship and it was used in the landmark 2015 report on Yangon's startup ecosystem. The approach is based on a good understanding of what enables entrepreneurs to start and grow their enterprises. It avoids approaches tried by other countries that have not proved to be effective. For example, subsidized incubators and government-funded grant and loan programs have typically not been effective, since they tend to reach only a small group of beneficiaries that can navigate approval processes. It is far more important to encourage what is called an "entrepreneurial ecosystem," which can encourage a broad and diverse set of entrepreneurs to emerge.

In this study, Professor Isenberg's "Six Strategic Pillars of Entrepreneurship Ecosystem" is taken as a conceptual framework in order to conduct "Factor analysis of Myanmar Entrepreneurship Ecosystem". The survey questionnaire is constructed focusing on these six strategic pillars as mentioned above.

CHAPTER III

RESEARCH METHODOLOGY

In this chapter, research methodology of the study is discussed in detail. It includes survey design, reliability analysis and factor analysis. The survey design includes questionnaire design, sample size determination and data collection methods. Reliability analysis includes reliability test and testing for sampling adequacy. Factor analysis includes orthogonal factor model, methods of estimation, residual matrix and factor rotation.

3.1 Survey Design

Sample survey is the most commonly used method for primary data collection. The sample survey was conducted in Myanmar Young Entrepreneurs Association (MYEA) to obtain the required information. To carry out the survey, it is needed to state clearly the objectives of the survey. The objectives of the survey under the study are to collect data on demographic and socioeconomic characteristics of entrepreneurs, and to analyze the crucial factors for perception on the level of importance of six strategic pillars of entrepreneurship ecosystem.

3.1.1 Questionnaire Design

To find out the identifying factors of Myanmar entrepreneurship ecosystem, a structured questionnaire survey was used to acquire the required data on demographic and socio-economic characteristics of entrepreneurs from Myanmar Young Entrepreneurs Association (MYEA).

The survey was composed of two parts of the questions. The first part of the questionnaire was the demographic and socioeconomic characteristics of Myanmar entrepreneurs and their businesses nature. The second part was composed of the questions which provided perception on the level of importance of six strategic pillars of entrepreneurship ecosystem such as finance, market, technology, human resource, entrepreneurship culture and government support. The questionnaire included 64 questions. There were 16 questions demographic and socioeconomic characteristics and the rest 48 questions are five-point likert scale questioners.

The study adhered to the ethical considerations as follows:

- Permission to conduct the survey was taken in advance from the Myanmar Young Entrepreneurs Association (MYEA)
- Interviewers were organized and trained properly to keep information security and ethical issues.
- Interviewees were respected for the autonomy and self-determination with their sole consent to participate in survey. This study takes respondents data on highly confidentiality.

3.1.2 Sample Size Determination

In this study, a simple random sampling design was used to carry out a sample survey. In line with the proposed sampling design, 260 entrepreneurs were randomly selected from Myanmar Young Entrepreneurs Association (MYEA). The population is 779 active members of Myanmar Young Entrepreneurs Association (MYEA) in 2019, the required sample size was calculated using Cochran's method.

$$n = \frac{n_0}{1 + \frac{n_0 - 1}{N}}$$

where,

$$n_0 = \frac{Z^2 p (1-p)}{e^2}$$

N = population size = 779

Z = 95% confidence level = 1.96

e = desired level of precision = 0.05

p = estimated population proportion = 0.5

Therefore,

$$n_0 = \frac{(1.96)^2 (0.5)(1-0.5)}{(0.05)^2} = 385$$

$$\text{Hence, } n = \frac{385}{1 + \frac{(385-1)}{779}} = 260$$

According to the calculation, the required sample size was at least 260 members.

3.1.3 Data Collection Method

The training of interviewers was held in the first week of July 2019. The training involved explaining the objectives of the sample survey, discussing the questionnaires and visiting enumeration areas. The target population consisted of 779 active members of Myanmar Young Entrepreneurs Association (MYEA) in 2019. The data collection of the respondents was conducted by sending out survey questionnaire form to the address of these respondents using postal service and also follow up calls via phone for their feedback.

3.2 Reliability Analysis

Reliability is the scale construction counterpart of precision and accuracy in physical measurement. Reliability can be thought of as consistency in measurement. To establish the reliability of the data, the reliability coefficient (Cronbach Alpha) was verified. There are a number of different reliability coefficients. One of the most commonly used is Cronbach's alpha. Cronbach's alpha can be interpreted as a correlation coefficient; it ranges a value from 0 to 1. Robinson and Shaver (1973) suggested that if Alpha is greater than 0.7, it means high reliability and if Alpha is smaller than 0.3, it means low reliability.

3.2.1 Reliability Test

Before using the factor analysis, it is very important to test the reliability of the dimensions in the questionnaires. Cronbach's alpha, a statistical test used to examine the internal consistency of attributes, was determined for each dimension. This statistical test shows the attributes are related to each other and to the composite scores. The composite scores for each section of the questionnaires was obtained by summing up the scores of individual statements. Cronbach's alpha is defined as –

$$\alpha = \frac{K}{K-1} \left[1 - \frac{\sum_{i=1}^k S_i^2}{S_T^2} \right] \quad (3.1)$$

Where,

- α = Cronbach's alpha,
- K = Number of Statement
- S_i^2 = variance of each statement
- S_T^2 = variance for sum of all items

3.2.2 Testing for Sampling Adequacy

Kaiser-Meyer-Olkin (KMO) test is a measure of how suited the data is for Factor Analysis. The test measures sampling adequacy for each variable in the model and for the complete model. The statistics is a measure of the proportion of variance among variables that might be common variance. If lower the proportion, the more suited the data is to Factor Analysis. KMO takes the value between 0 and 1. A rule of thumb for interpreting the statistic. KMO value lies between 0.8 and 1.0 indicate the sampling is adequate. KMO value less than 0.6 indicates the sampling is not adequate and that remedial action should be taken. KMO values close to zero means that there are large partial correlations compared to the sum of correlations. In other words, there are widespread correlations which are a large problem for factor analysis

The Bartlett's test of Spherically relates to the significance of the study and thereby shows the validity and suitability of the responses collected to the problem being addressed through the study. For a large sample, Bartlett's test approximates a Chi-square distribution. However, the Bartlett's test compares the observed correlation matrix to the identity matrix. Therefore, the Bartlett's test forms something of a bottom-line test for large samples, but is less reliable for small samples. For factor analysis to be recommended suitable, the Bartlett's Test of Sphericity must be less than 0.05. In addition, very small values of significance (below 0.05) indicate a high probability that is significance relationship between the variables, whereas higher values (0.1 or above) indicate the data is inappropriate for factor analysis.

3.3 Factor Analysis

3.3.1 Orthogonal Factor Model

The orthogonal factor (Richard A. Johnson, 1992) was described. The observable random vector \mathbf{X} , with p components, has mean μ and covariance matrix Σ . The factor model postulates that \mathbf{X} is linearly dependent upon a few unobservable random variables F_1, F_2, \dots, F_m , called common factors, and p additional sources of variation e_1, e_2, \dots, e_p , called errors or, sometimes, specific factors. in particular, the factor model can be selected as follows:

communality. That portion of $\text{Var}(X_i) = \sigma_{ii}$ due to the specific factor is called uniqueness or specific variance. Denoting the i^{th} communality by h_i^2 ,

$$\frac{\sigma_{ii}}{\text{Var}(X_i)} = \underbrace{\ell_{i1}^2 + \ell_{i2}^2 + \dots + \ell_{im}^2}_{\text{communality}} + \underbrace{\psi_i}_{\text{Specific Variance}} \quad (3.3)$$

or

$$h_i^2 = \ell_{i1}^2 + \ell_{i2}^2 + \dots + \ell_{im}^2$$

and

$$\sigma_{ii} = h_i^2 + \psi_i, \quad i = 1, 2, \dots, p$$

The i^{th} communality is the sum of squares of the loadings of the i^{th} variable on the m common factors.

3.3.2 Methods of Estimation

The sample covariance matrix \mathbf{S} is an estimator of the unknown population covariance matrix Σ . If the off-diagonal elements of \mathbf{S} are small or those of the sample correlation matrix \mathbf{R} essentially zero, the variables are not related, and a factor analysis will not prove useful. In these circumstances, the specific factors play the dominant role, whereas the major aim of factors analysis is to determine a few important common factors (Richard A. Johnson, 1992).

If Σ appears to deviate significantly from a diagonal matrix, then a factor model can be entertained, and the initial problem is one of estimating the factor loadings ℓ_{ij} and specific variances ψ_i . Two most popular methods of the parameter estimation are the principal component method and the maximum likelihood method. the solution from either method can be rotated in order to simplify the interpretation of factors. If the factor model is appropriate for the problem to try more than one method of solutions should be consistent with one another.

The Principal Component Method

The Principal Factor (Richard A. Johnson, 1992) was described. The spectral decomposition provides us with one factoring of the covariance matrix Σ . Let Σ have eigenvalue – eigenvector pairs (λ_i, e_i) with $\lambda_1 \geq \lambda_2 \geq \dots \geq \lambda_p \geq 0$. then,

$$\Sigma = \lambda_1 e_1 e_1' + \lambda_2 e_2 e_2' + \dots + \lambda_p e_p e_p'$$

$$= [\sqrt{\lambda_1}e_1 \ : \ \sqrt{\lambda_2}e_2 \ : \ \dots \ : \ \sqrt{\lambda_p}e_p] \begin{bmatrix} \sqrt{\lambda_1}e'_1 \\ \dots \\ \sqrt{\lambda_2}e'_2 \\ \dots \\ \vdots \\ \dots \\ \sqrt{\lambda_p}e'_p \end{bmatrix}$$

This fits the prescribed covariance structure for the factor analysis model having as many factors as variables ($m = p$) and specific variances $\psi_i = 0$ for all i , the loading matrix has j th column given by $\sqrt{\lambda_i}e_j$. This can be written

$$\underset{(p \times p)}{\Sigma} = \underset{(p \times p)}{\mathbf{L}} \underset{(p \times p)}{\mathbf{L}'} + \underset{(p \times p)}{\mathbf{0}} = \mathbf{L}\mathbf{L}' \quad (3.4)$$

Apart from the scale factor $\sqrt{\lambda_i}$, the factor loadings on the j^{th} factor are the coefficients for the j th principal component of the population.

Although the factor analysis representation of Σ is exact, it is not particularly useful. It employs as many common factors as there are variables and does not allow for any variation in the specific factors $\boldsymbol{\varepsilon}$. One approach when the last $p-m$ eigenvalues are small, is to neglect the contribution of $\lambda_{m+1}e_{m+1}e'_{m+1} + \dots + \lambda_p e_p e'_p$ to Σ . Neglecting this contribution, the approximation is obtained.

$$\Sigma = [\sqrt{\lambda_1}\mathbf{e}_1 \ : \ \sqrt{\lambda_2}\mathbf{e}_2 \ : \ \dots \ : \ \sqrt{\lambda_m}\mathbf{e}_m] \begin{bmatrix} \sqrt{\lambda_1}e'_1 \\ \dots \\ \sqrt{\lambda_2}e'_2 \\ \dots \\ \vdots \\ \dots \\ \sqrt{\lambda_m}e'_m \end{bmatrix} = \underset{(p \times m)}{\mathbf{L}} \underset{(m \times p)}{\mathbf{L}'}$$

The approximate representation is assuming that the specific factors $\boldsymbol{\varepsilon}$ are of minor importance and can also be ignored in the factoring of Σ . The approximation can be written as following:

$$\Sigma = \mathbf{L}\mathbf{L}' + \boldsymbol{\Psi} \quad (3.5)$$

$$= [\sqrt{\lambda_1} \mathbf{e}_1 \ : \ \sqrt{\lambda_2} \mathbf{e}_2 \ : \ \dots \ : \ \sqrt{\lambda_m} \mathbf{e}_m] \begin{bmatrix} \sqrt{\lambda_1} \mathbf{e}'_1 \\ \sqrt{\lambda_2} \mathbf{e}'_2 \\ \vdots \\ \sqrt{\lambda_m} \mathbf{e}'_m \end{bmatrix} + \begin{bmatrix} \psi_1 & 0 & \dots & 0 \\ 0 & \psi_2 & \dots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \dots & \psi_p \end{bmatrix}$$

where $\psi_i = \sigma_{ii} - \sum_{j=1}^m \ell_{ij}^2$ for $i = 1, 2, \dots, p$

To apply this approach to a data set $\mathbf{x}_1, \mathbf{x}_2, \dots, \mathbf{x}_n$, it is customary first to center the observations by subtracting the sample mean \bar{x} . The cantered observations

$$\mathbf{x}_j - \bar{\mathbf{x}} = \begin{bmatrix} x_{j1} \\ x_{j2} \\ \vdots \\ x_{jp} \end{bmatrix} - \begin{bmatrix} \bar{x}_1 \\ \bar{x}_2 \\ \vdots \\ \bar{x}_p \end{bmatrix} = \begin{bmatrix} x_{j1} - \bar{x}_1 \\ x_{j2} - \bar{x}_2 \\ \vdots \\ x_{jp} - \bar{x}_p \end{bmatrix}, \quad j = 1, 2, \dots, n$$

have the same sample covariance matrix \mathbf{S} as the original observations.

In cases where the units of the variables are not commensurate, it is usually desirable to work with the standardized variables.

$$\mathbf{z}_j = \begin{bmatrix} \frac{(x_{j1} - \bar{x}_1)}{\sqrt{s_{11}}} \\ \frac{(x_{j2} - \bar{x}_2)}{\sqrt{s_{22}}} \\ \vdots \\ \frac{(x_{jp} - \bar{x}_p)}{\sqrt{s_{pp}}} \end{bmatrix}, \quad j = 1, 2, \dots, n$$

This sample covariance matrix is the sample correlation matrix \mathbf{R} of the observations $\mathbf{x}_1, \mathbf{x}_2, \dots, \mathbf{x}_n$. Standardization avoids the problems of having one variable with large variance unduly influencing the determination of factor loadings. The sample covariance matrix \mathbf{S} or the sample correlation matrix \mathbf{R} is known as principal component solution. The principal component solution (Richard A. Johnson, 1992) was described. The principal component factor analysis of the sample covariance matrix \mathbf{S} is specified in terms of its eigenvalue – eigenvector pairs $(\hat{\lambda}_1, \hat{e}_1), (\hat{\lambda}_2, \hat{e}_2), (\hat{\lambda}_3, \hat{e}_3), \dots, (\hat{\lambda}_p, \hat{e}_p)$ where $\hat{\lambda}_1 \geq \hat{\lambda}_2 \geq \hat{\lambda}_3 \geq \dots \geq \hat{\lambda}_p$. Let $m < p$ be the number of common factors. Then the matrix of estimated factor loading $(\tilde{\ell}_{ij})$ is given ...

$$\tilde{\mathbf{L}} = \left[\sqrt{\hat{\lambda}_1} \hat{\mathbf{e}}_1 \mid \sqrt{\hat{\lambda}_2} \hat{\mathbf{e}}_2 \mid \sqrt{\hat{\lambda}_3} \hat{\mathbf{e}}_3 \mid \dots \mid \sqrt{\hat{\lambda}_p} \hat{\mathbf{e}}_p \right]$$

The estimated specific variance are provided by the diagonal elements of the matrix $\mathbf{S} - \tilde{\mathbf{L}}\tilde{\mathbf{L}}'$.

$$\tilde{\Psi} = \begin{bmatrix} \tilde{\psi}_1 & 0 & \dots & 0 \\ 0 & \tilde{\psi}_2 & \dots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \dots & \tilde{\psi}_p \end{bmatrix} \quad \text{with} \quad \tilde{\psi}_i = s_{ii} - \sum_{j=1}^m \tilde{\ell}_{ij}^2$$

Communalities are estimated as

$$\tilde{h} = \tilde{\ell}_{i1}^2 + \tilde{\ell}_{i2}^2 + \dots + \tilde{\ell}_{im}^2 \quad (3.6)$$

The principal component factor analysis of the sample correlation matrix is obtained by starting with \mathbf{R} in place of \mathbf{S} .

3.3.3 Residual Matrix

If the number of common factors is not determined by a priori considerations based on the estimated eigenvalues in much the same manner as with principal component, consider the residual matrix

$$\mathbf{S} - (\tilde{\mathbf{L}}\tilde{\mathbf{L}}' + \tilde{\Psi}) \quad (3.7)$$

resulting from the approximation of \mathbf{S} by the principal component solution. The diagonal elements are zero. Sum of squared entries of

$$(\mathbf{S} - (\tilde{\mathbf{L}}\tilde{\mathbf{L}}' + \tilde{\Psi})) \leq \hat{\lambda}_{m-1}^2 + \dots + \hat{\lambda}_p^2$$

The contributions of the first few factors to the sample variances of the variables should be large. The contribution to the sample variance s_{ii} from the first common factor is $\tilde{\ell}_{i1}^2$. The contribution to the total sample variance, $s_{11} + s_{22} + \dots + s_{pp} = \text{tr}(\mathbf{S})$, from the first common factor is then

$$\tilde{\ell}_{11}^2 + \tilde{\ell}_{21}^2 + \dots + \tilde{\ell}_{p1}^2 = (\sqrt{\hat{\lambda}_1} \hat{\mathbf{e}}_1)' (\sqrt{\hat{\lambda}_1} \hat{\mathbf{e}}_1) = \hat{\lambda}_1$$

since the eigenvector $\hat{\mathbf{e}}_1$ has unit length. In general

$$\left(\begin{array}{l} \text{Proportion of total} \\ \text{sample variance} \\ \text{due to } j\text{th factor} \end{array} \right) = \begin{cases} \frac{\hat{\lambda}_j}{s_{11} + s_{11} + s_{11} + \dots + s_{pp}} & \text{for a factor analysis of } \mathbf{S} \\ \frac{\hat{\lambda}_j}{p} & \text{for a factor analysis of } \mathbf{R} \end{cases}$$

Frequently used as a heuristic device for determining the appropriate number of common factors. The number of common factors retained in the model is increased until a “suitable proportion” of the total sample variance has been explained.

3.3.4 Factor Rotation

The factor rotation (Richard A. Johnson, 1992) was described. All factor loadings obtained from the initial loadings by a orthogonal transformation have the same ability to reproduce the covariance matrix. An orthogonal transformation of the factor loadings as well as the implied orthogonal transformation of the factors is called factor rotation. If $\hat{\mathbf{L}}$ if the $p \times m$ matrix of estimated factor loadings obtained by any method; then

$$\hat{\mathbf{L}}^* = \hat{\mathbf{L}}\mathbf{T}, \quad \text{where } \mathbf{T}\mathbf{T}' = \mathbf{T}'\mathbf{T} = \mathbf{I} \quad \text{is a } p \times m \text{ matrix of rotated loadings.}$$

The estimated covariance matrix remains unchanged, since

$$\hat{\mathbf{L}}\hat{\mathbf{L}}' + \hat{\Psi} = \hat{\mathbf{L}}\mathbf{T}\mathbf{T}'\hat{\mathbf{L}} + \hat{\Psi} = \hat{\mathbf{L}}^* \hat{\mathbf{L}}^{*'} + \hat{\Psi}$$

Equation indicates that the residual matrix, $\mathbf{S}_n - \hat{\mathbf{L}}\hat{\mathbf{L}}' - \hat{\Psi} = \mathbf{S}_n - \hat{\mathbf{L}}^* \hat{\mathbf{L}}^{*'} + \hat{\Psi}$ remains unchanged. The specific variance $\widehat{\psi}_i$ and hence the communalities \widehat{h}_i^2 , are unaltered. Thus, from a mathematical viewpoint, it is immaterial whether $\hat{\mathbf{L}}$ or $\hat{\mathbf{L}}^*$ is obtained.

The original loading may not be readily interpretable. It is usual practice to rotate until a simpler structure is achieved. Each variable loads-highly on a single factor and has small to moderate loadings on the remaining factors. It is possible to get this simple structure and the rotated loading for the decathlon data provide a clear pattern. Graphical and analytical methods should be concentrated for determining an orthogonal rotation to a simple structure.

Oblique Rotation

The oblique rotation (Richard A. Johnson, 1992) was described. Orthogonal rotations are appropriate for a factor model in which the common factors are assumed to be independent. Many investigators in social sciences consider oblique (nonorthogonal) rotations, as well as orthogonal rotations. Oblique rotation is frequently a useful aid in factor analysis.

If the m common factors as coordinate axes, the point with the m coordinates $(\hat{\ell}_{i1}, \hat{\ell}_{i2}, \hat{\ell}_{i3}, \dots, \hat{\ell}_{im})$ represents the position of the i^{th} variable in the factor space. Assuming that the variables are grouped into non overlapping clusters, an orthogonal rotation to a simple structure corresponds to a rigid rotation of the coordinate axes such that the axes, after rotation, pass as frequent to the clusters as possible. An oblique rotation to a simple corresponds to a nonrigid rotation of the coordinate system such that the rotated axes (no longer perpendicular) pass (nearly) through the clusters. An oblique rotation seeks to express each variable in terms of a minimum number of factors preferably, a single factor.

Varimax Rotation

The varimax rotation (Richard A. Johnson, 1992) was described. When principal components analysis and factor analysis identify the underlying factors, they do so using a greedy algorithm. They begin by identifying the first component in such a way that it explains as much variance as possible, and proceed by identifying the next component in such a way that it explains the maximum possible amount of the remaining variance and so on.

In statistics, a varimax rotation is used to simplify the expression of a particular sub-space in terms of judging a few major items each. The actual coordinate system is unchanged, it is the orthogonal basis that is being rotated to align with those coordinates. The sub-space found with principal component analysis or factor analysis is expressed as a dense basis with many non-zero weights which makes it hard to interpret. Varimax is so called because it maximizes the sum of the variances of the squared loadings (squared correlations between variables and factors). In addition to, varimax rotation, where the factor axes are kept at right angles to each other, is most frequently chosen. Ordinarily, rotation reduces the number of complex variables and

improves interpretation. Almost all applications of principal component analysis and factor analysis in survey research apply the varimax rotation method.

3.3.5 Velicer's Minimum Average Partial (MAP) Test for Verifying Analysis

The MAP method (Velicer, 1976) was developed in the context of principal component analysis and is based on the matrix of partial correlations. Each component is partialled out of the correlation matrix and the average of the squared partial correlations is computed. The number of factors to retain is determined by the point where the minimum average of the squared partial correlations is obtained. The rationale of this procedure can be described as follows: as common variance is partialled out of the correlation matrix for each successive component, the MAP criterion will keep on decreasing. At the point where the common variance has been removed, extracting additional components will result in unique variance being partialled out, and the MAP criterion will begin to rise. The MAP procedure, therefore, provides an unequivocal stopping point for the number of factors by separating the common and unique variance and retaining only those factors that consist primarily of common variance. The MAP procedure begins with the computation of the partial covariance matrix,

$$C_m = \mathbf{R} - A_m A_m^T \quad (3.8)$$

C_m = The partial covariance Matrix that results from partialling out the first m components from \mathbf{R}

\mathbf{R} = The correlation matrix

A_m = The component loading matrix for components 1 to m .

Next, the partial correlation matrix is obtained

$$R_m^* = D^{-\frac{1}{2}} C_m D^{-\frac{1}{2}} \quad (3.9)$$

R_m^* = The partial correlation matrix

D = $\text{diag}(C_m)$

The MAP criterion is then obtained by averaging the squares of the partial correlations contained in R_m^* .

$$\text{MAP}_m = \sum_{i=1}^p \sum_{\substack{j=1 \\ i \neq j}}^p \frac{r_{ijm}^{*2}}{p(p-1)} \quad (3.10)$$

where p is the number of variables

This procedure is repeated until $p - 1$ components have been partialled out of \mathbf{R} (partialling out p components would result in a null partial covariance matrix). Finally, the first factor by averaging the squares of the correlations contained in \mathbf{R} :

$$\text{MAP}_0 = \sum_{i=1}^p \sum_{\substack{j=1 \\ i \neq j}}^p \frac{r_{ij}^2}{p(p-1)} \quad (3.11)$$

$\text{MAP}_0 < \text{MAP}_1$, no factors should be extracted

MAP method with continuous variables had been evaluated in some of the most relevant factor retention. Zwick and Velicer (1982) carried out the first systematic examination of this procedure and found it to be more accurate than other stopping rules such as the eigenvalue greater than 1 rule and Bartlett's significance test .

Their results also showed that it was affected primarily by the size of the factor loadings and had a tendency to under factor with a small number of variables per factor. The same tendency to under factor with low factor loadings and a small number of variables per factor was found in this study, replicating previous results.

CHAPTER IV

RESULTS AND FINDINGS

In this chapter, it has been presenting the analysis of the factors influencing in Myanmar Entrepreneurship Ecosystem based on results of data collected from the sample. The descriptive data analysis, factor analysis, reliability test, and verification of the key main factors are worked out in accordance with the theories.

4.1 Demographic and Socioeconomic Characteristics of Myanmar Entrepreneurs

4.1.1 Gender of Entrepreneurs

Gender of entrepreneurs is shown in Table (4.1) and Figure (4.1). Out of 260 respondents, 140 (54%) were male and 120 (46%) were female respectively.

Table (4.1) Percent Distribution of Gender of Entrepreneurs

| Gender | Number of Entrepreneurs | Percent (%) |
|--------------|----------------------------|----------------|
| Male | 140 | 54% |
| Female | 120 | 46% |
| Total | 260 | 100% |

Source: Entrepreneurship Survey Data, 2019

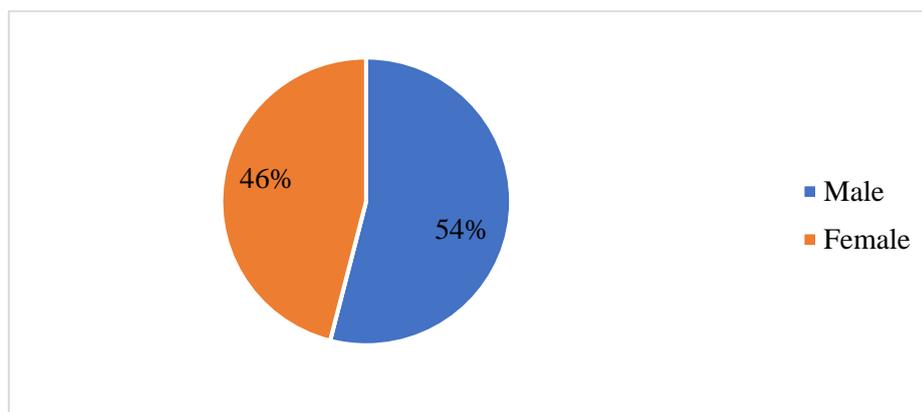

Figure (4.1) Percent Distribution of Entrepreneurs by Gender

4.1.2 Age of Entrepreneurs

Age of entrepreneurs was classified in 7 groups such as 20 to 24 years, 25 to 29 years, 30 to 34 years, 35 to 39 years, 40 to 44 years, 45 to 55 years and above 55 years.

Table (4.2) Percent Distribution of Entrepreneurs by Age

| Age (Years) | Number of Entrepreneurs | Percent (%) |
|--------------|-------------------------|-------------|
| 20-24 | 16 | 6.0% |
| 25-29 | 50 | 19.1% |
| 30-34 | 52 | 19.9% |
| 35-39 | 42 | 16.3% |
| 40-44 | 43 | 16.7% |
| 45-55 | 43 | 16.7% |
| Over 55 | 14 | 5.3% |
| Total | 260 | 100% |

Source: Entrepreneurship Survey Data, 2019

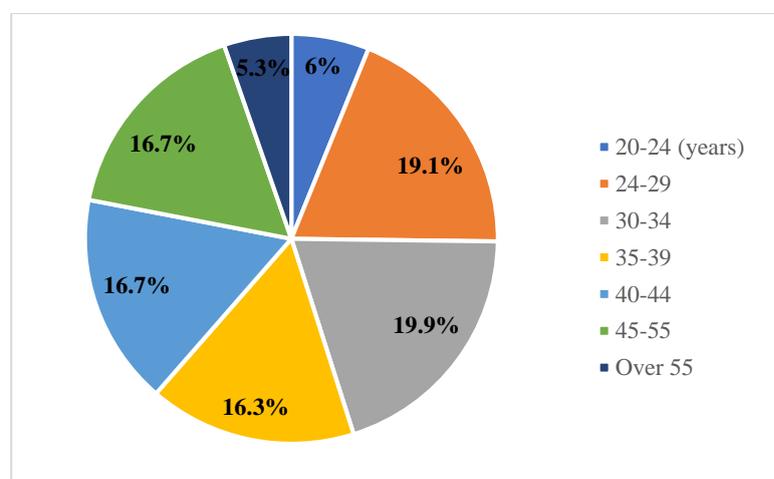

Figure (4.2) Percent Distribution of Entrepreneurs by Age

According to Table (4.2) and Figure (4.2), the most entrepreneurs (19.9%) were age group of 30-34 years, followed by age groups 25-29 years (19.1%), 40-44 years and 45-55 years (16.7%), 35-39 years (16.3%), 20-24 years (6%) and over 55 years (5.3%).

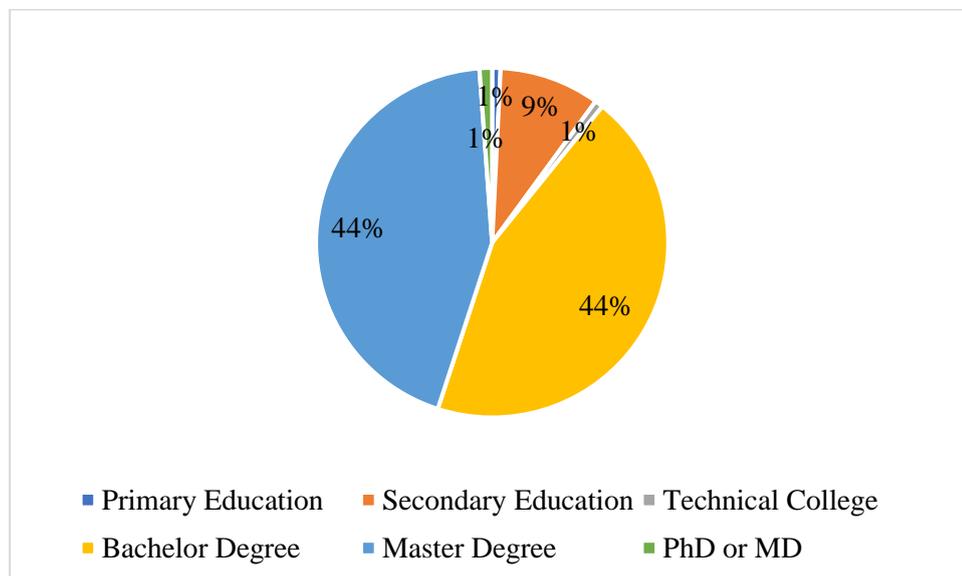

4.1.3 Educational Level of Entrepreneurs

The entrepreneurs' educational level was categorized into six groups such as primary education, secondary education, technical college, bachelor, master degree, Ph.D or medical doctorate are shown in Table (4.3).

Table (4.3) Distribution of Educational Level of Entrepreneurs

| Educational Level | Number of Entrepreneurs | Percent (%) |
|--------------------------|--------------------------------|--------------------|
| Primary Education | 2 | 1% |
| Secondary Education | 24 | 9% |
| Technical College | 2 | 1% |
| Bachelor Degree | 115 | 44% |
| Master Degree | 114 | 44% |
| PhD or MD | 3 | 1% |
| Total | 260 | 100% |

Source: Entrepreneurship Survey Data, 2019

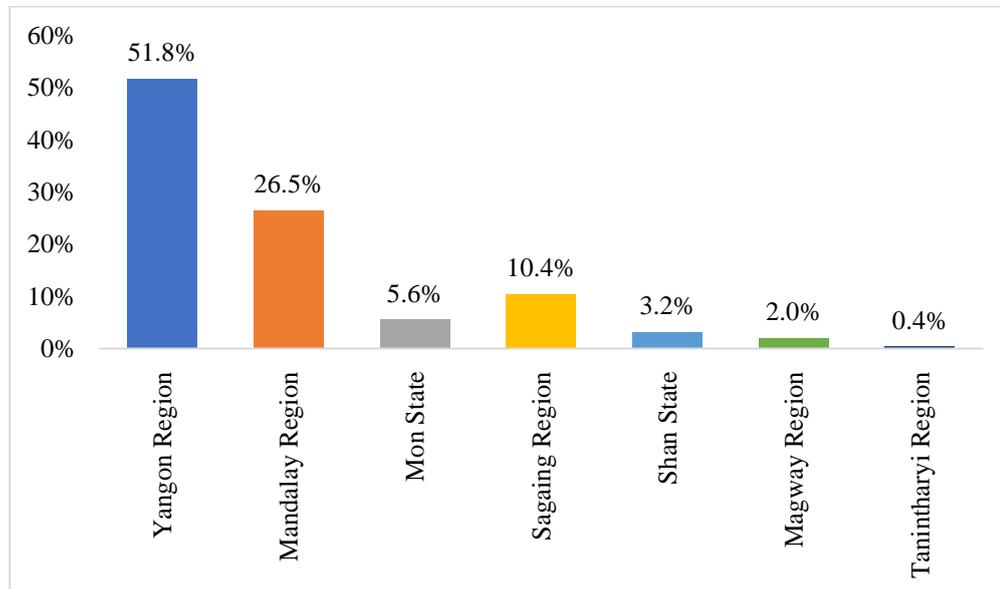

Source: Entrepreneurship Survey Data, 2019

Figure (4.3) Distribution of Educational Level of Entrepreneurs

According to Table (4.3) and Figure (4.3), the most entrepreneurs (44%) were achieved Bachelor and Master degrees, followed by secondary education (9%), Ph.D or Medical Doctorate (1%) and primary education (1%).

4.1.4 Geographical Distribution of Entrepreneurs

The sample also has reasonable geographic representation in major states and regions of Myanmar as show in Figure (4.4).

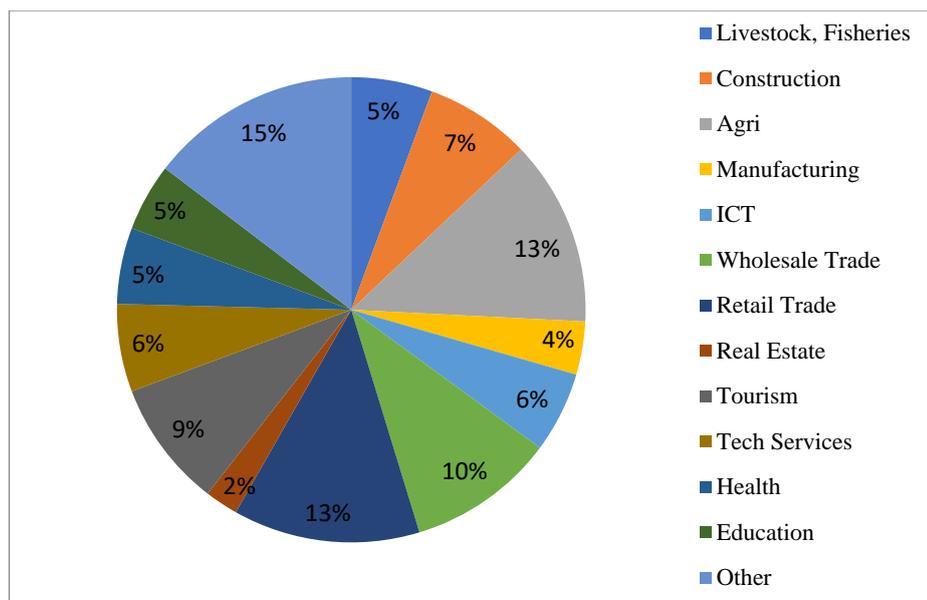

Source: Entrepreneurship Survey Data, 2019

Figure (4.4) Distribution of Entrepreneurs' Geographical Status

The survey shows that 51.8% of entrepreneurs lived in Yangon Region, 26.5% entrepreneurs lived in Mandalay Region and the rest are 20.6% entrepreneurs in total from different states and regions across country.

4.1.5 Business Sectors of Entrepreneurs

The sectors of business are categorized into 13 groups such as livestock and fisheries, construction, agriculture, manufacturing, ICT, wholesale trade, retail trade, real estate, tourism, technical services, health, education and others are shown in Figure (4.5).

Source: Entrepreneurship Survey Data, 2019

Figure (4.5) Distribution of Entrepreneurs by Business Sector

Almost all respondents are from small- or medium-sized companies in wide range of business sectors. Out of 13 categories, the entrepreneurs working in agribusiness and retail trade are with high contribution of 13% each while the lowest sector shows in real estate by 2%. The other 15% of entrepreneurs are working in unimportant sectors of business.

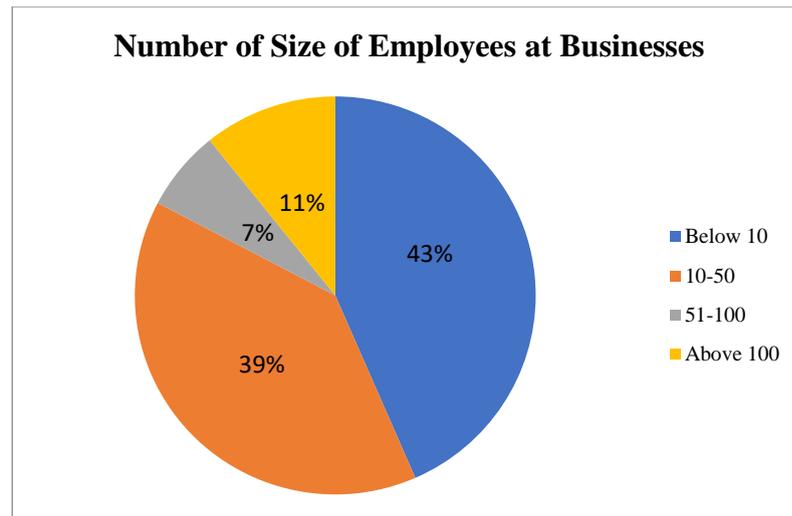

4.1.6 Employment Status in Entrepreneurs' Businesses

The size of employees at businesses are classified as below 10 employees, 10-50 employees, 51-100 employees and above 100 employees. The number of full-time paid employees working at the entrepreneurs' businesses are shown in Table 4.4 and Figure (4.6).

Table (4.4) Employees at Entrepreneurs' Businesses

| Size of Employee | Number of Business | Percent (%) |
|------------------|--------------------|-------------|
| Below 10 | 113 | 43% |
| 10-50 | 102 | 39% |
| 51-100 | 17 | 7% |
| Above 100 | 28 | 11% |
| Total | 260 | 100% |

Source: Entrepreneurship Survey Data, 2019

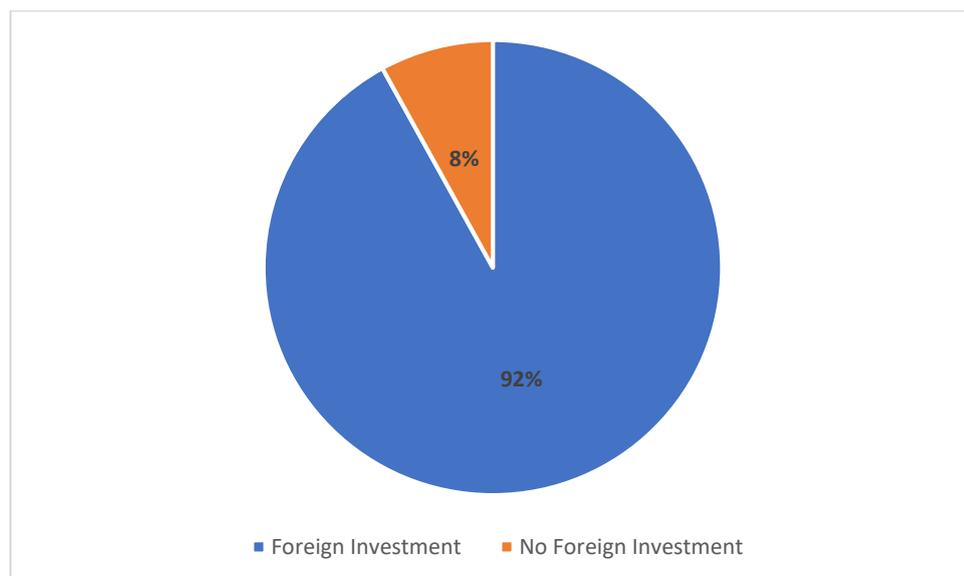

Source: Entrepreneurship Survey Data, 2019

Figure (4.6) Distribution of Size of Employees at Businesses

According to the results of Table 4.4 and Figure 4.6, 43% of businesses have below 10 employees, 39% of businesses have 10-50 employees, 11% of businesses have above 100 employees and 7% of businesses have 51-100 employees. It is found that most of the entrepreneurs in Myanmar are micro and small business owners.

4.1.7 Foreign Investment in Entrepreneurial Business

The franchise, direct investment or joint venture with foreign investment contribution was shown in Figure (4.7).

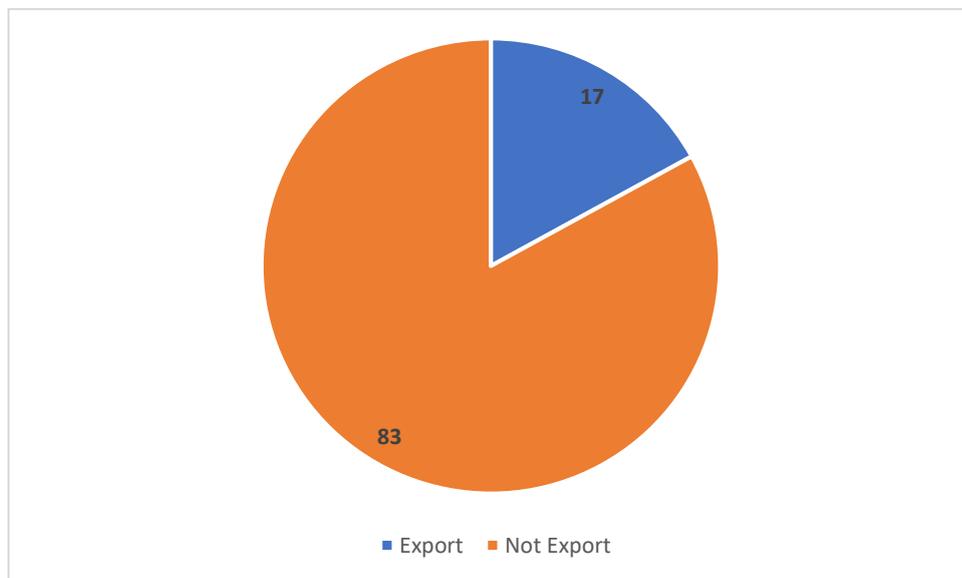

Source: Entrepreneurship Survey Data, 2019

Figure (4.7) Distribution of Foreign Investment

According to the figure, it showed that 8% of the entrepreneurs received the foreign investment, or acting as a branch office of a multi-national company and the other 92% do not receive Foreign Investment.

4.1.8 Export Business of Entrepreneurs

Export businesses of entrepreneurs are described in Figure (4.8). It can be seen that 17% of the businesses are doing export of their products and/or services. The rest 83% of the businesses claimed that they never export to other countries.

Source: Entrepreneurship Survey Data, 2019

Figure (4.8) Distribution of Export Business

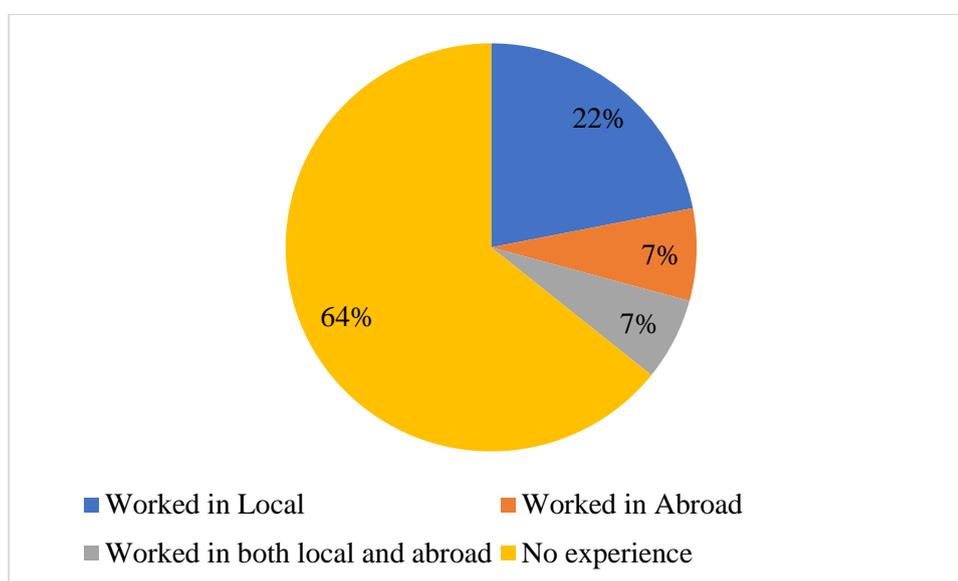

4.1.9 Working Experience of Entrepreneurs

Entrepreneur's working experiences are described in Table (4.5) and Figure (4.9). Working experience are classified as worked in local company, worked in foreign company, worked in local and foreign company and no experience. It can be seen that 22% of the entrepreneurs had experience of working at the local company in Myanmar whilst 7% of them were in abroad. Nearly 7% of the entrepreneurs answered that they had worked in both local and in foreign companies. Nevertheless, the majority of the entrepreneurs 64% did not have working experience before they run their own businesses.

Table (4.5) Percent Distribution of Working Experience of Entrepreneurs

| Working Experience | Number of Entrepreneurs | Percent (%) |
|---------------------------------|--------------------------------|--------------------|
| Worked in Local | 57 | 22% |
| Worked in Abroad | 19 | 7% |
| Worked in both local and abroad | 17 | 7% |
| No experience | 167 | 64% |
| Total | 260 | 100% |

Figure (4.9) Working Experience of Entrepreneurs

4.1.10 Business Registration Status of Entrepreneurs

The business registration status of the entrepreneurs is shown in Table (4.6). It is found that 44.7% of the businesses have company registration at Directorate of Investment and Company Administration (DICA). The others 42.3% of the businesses are running under the municipal and shop license only. The rest 4.1% of businesses are not registered at anywhere yet.

Table (4.6) Business Registration Status of Entrepreneurs

| Types of Business Registration | Number of Respondents | Percent (%) |
|---------------------------------------|------------------------------|--------------------|
| With DICA | 116 | 44.70% |
| Locally (Municipal) | 33 | 12.60% |
| Shop License | 77 | 29.70% |
| Not Registered as a Company | 11 | 4.10% |
| Other (Please Specify) | 23 | 8.90% |
| Total | 260 | 100% |

4.2 Understanding the Status of Strategic Pillars of Entrepreneurship Ecosystem in Myanmar

The approach is based on a good understanding of what enables entrepreneurs to start and grow their enterprises. This survey was built on six strategic pillars that create a dynamic ecosystem to enable growth entrepreneurship. This widely used framework was developed by Professor Daniel Isenberg¹ of Babson College in the United States. The ecosystem's performance is measured by tracking the number of startups, the number of high-growth firms, the levels of high-impact entrepreneurs, the number of serial entrepreneurs, data on the aspirational values of young people, and investments in the entrepreneurship sector within the sample of MYEA members.

It is now important to assess the status of each of the six pillars in Myanmar's entrepreneurship ecosystem and to consider specific initiatives and policies that can strengthen the ecosystem. The six pillars are representing factors to be carried out in this survey. The environment in Myanmar for each strategic pillar of a dynamic entrepreneurship ecosystem is assessed below.

4.2.1 Entrepreneurship Ecosystem Pillar 1: Access to Finance Factor

Table (4.7) shows that the sources of investment that the Myanmar entrepreneurs initiated their businesses. Myanmar entrepreneurs acquired the

¹ **Daniel Isenberg** is a **Professor** of Entrepreneurship Practice at Babson College Executive Education where he established the Babson Entrepreneurship Ecosystem Project. He is the author of the recent best seller "Worthless, Impossible and Stupid: How Contrarian Entrepreneurs Create and Capture Extraordinary Value".

investment to start their businesses initially. The 68% of entrepreneurs answered that personal saving or family saving was essential for their sources of investment while 31% thought that finance from relatives or friends were significant. Others responded that borrowing from banks or equity investments from an institution were insignificant as 29% and 30% respectively.

Table (4.7) Sources of Investment

| Sources of Investment | | Responded “essential” | Responded “very important” | Responded “significant” | Responded “insignificant” | Responded “no opinion” |
|--|------------|--------------------------|----------------------------------|----------------------------|------------------------------|------------------------------|
| Personal or family savings | Number | 177 | 50 | 24 | 4 | 4 |
| | Percentage | 68% | 19% | 9% | 2% | 2% |
| Finance from relatives/friends | Number | 33 | 54 | 79 | 68 | 25 |
| | Percentage | 13% | 21% | 31% | 26% | 10% |
| Borrowing from banks | Number | 48 | 50 | 59 | 74 | 28 |
| | Percentage | 19% | 19% | 23% | 29% | 11% |
| Borrowing from non-banks | Number | 17 | 44 | 85 | 79 | 35 |
| | Percentage | 7% | 17% | 33% | 30% | 13% |
| Equity Investment from non-Friend or Family | Number | 25 | 51 | 73 | 75 | 36 |
| | Percentage | 10% | 19% | 28% | 29% | 14% |
| Equity Investment from an institution | Number | 22 | 38 | 59 | 79 | 62 |
| | Percentage | 8% | 15% | 23% | 30% | 24% |

Source: Entrepreneurship Survey Data, 2019

4.2.2 Entrepreneurship Ecosystem Pillar 2: Access to Market Factor

One important factor of access to market is highly competitiveness. Table 4.8 shows that the entrepreneurs replied their attributes of product/ service or technology innovation were essential with highest percentage of 54% and 37% respectively. Business culture and efficient processes or logistics were very important by 37% and 31%, although unique market niche was either essential or significant by 33%. Aggressive marketing and selling were in the essential role, whilst distribution innovation and special agreement with suppliers were very important as 31% and 31% each.

Table (4.8) Important Attributes of Highly Competitiveness

| Attributes of Highly Competitiveness | | Responded “essential” | Responded “very important” | Responded “significant” | Responded “insignificant” | Responded “no opinion” |
|--|------------|--------------------------|----------------------------------|----------------------------|------------------------------|------------------------------|
| Product/service innovation | Number | 140 | 65 | 40 | 5 | 10 |
| | Percentage | 54% | 25% | 16% | 2% | 4% |
| Technology innovation | Number | 96 | 72 | 62 | 12 | 19 |
| | Percentage | 37% | 28% | 24% | 4% | 7% |
| Business culture | Number | 67 | 95 | 78 | 15 | 5 |
| | Percentage | 26% | 37% | 30% | 6% | 2% |
| Efficient processes | Number | 74 | 80 | 73 | 13 | 19 |
| | Percentage | 29% | 31% | 28% | 5% | 7% |
| Unique market niche | Number | 86 | 70 | 85 | 11 | 7 |
| | Percentage | 33% | 27% | 33% | 4% | 3% |
| Aggressive marketing | Number | 77 | 74 | 76 | 22 | 11 |
| | Percentage | 30% | 28% | 29% | 8% | 4% |
| Distribution innovation | Number | 66 | 82 | 69 | 20 | 23 |
| | Percentage | 25% | 31% | 26% | 8% | 9% |
| Special agreements with suppliers or distributors | Number | 63 | 83 | 71 | 28 | 15 |
| | Percentage | 24% | 32% | 27% | 11% | 6% |

Source: Entrepreneurship Survey Data, 2019

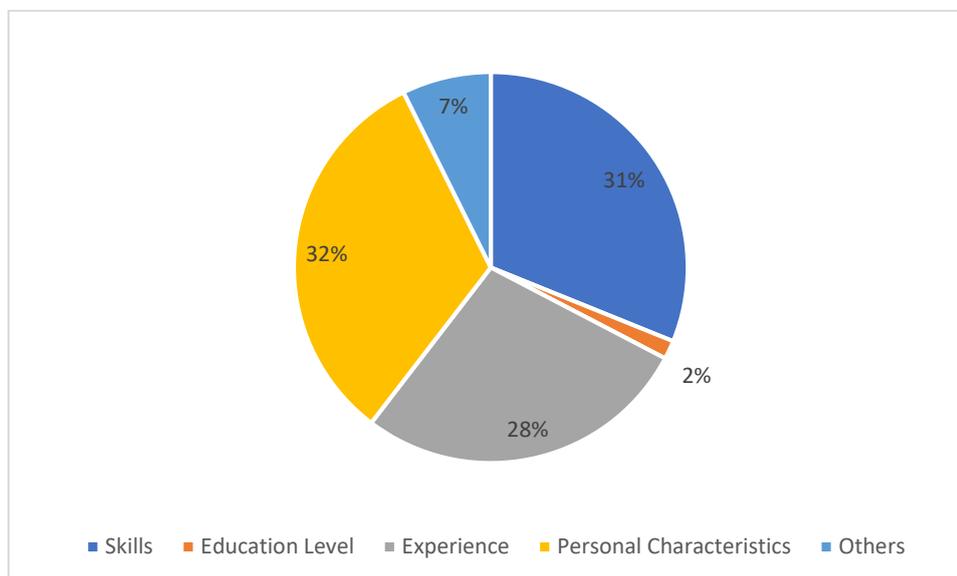

4.2.3 Entrepreneurship Ecosystem Pillar 3: Human Capital Factor

While entrepreneurs make the decision of hiring their employees, their most important criteria were employee’s personal characteristics by 32%, the skill follows in second important attribute at 31% and the previous experience in related job and industry was 28%. Surprisingly, the employees' educational level and other factors were not the priority for hiring decision as shown in Table (4.9) and Figure (4.10).

Table (4.9) Ranking Attributes of Hiring Employees

| Attribute | No. of Respondents | Percent (%) |
|--------------------------|--------------------|-------------|
| Skills | 81 | 31% |
| Education Level | 4 | 2% |
| Experience | 72 | 28% |
| Personal Characteristics | 84 | 32% |
| Others | 19 | 7% |
| Total | 260 | 100% |

Source: Entrepreneurship Survey Data, 2019

Source: Entrepreneurship Survey Data, 2019

Figure (4.10) Ranking Attributes of Hiring Employees

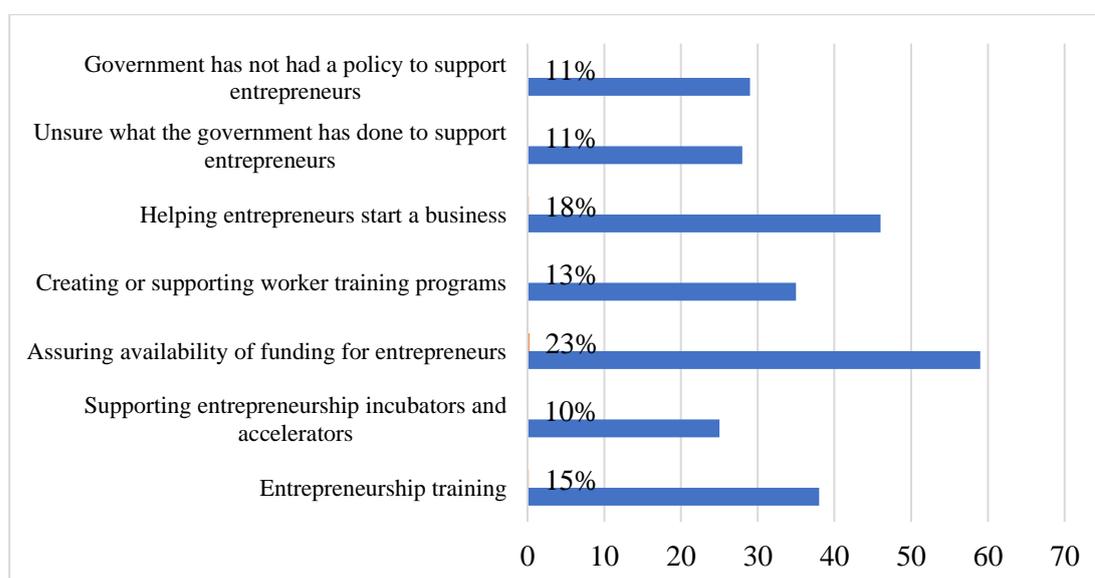

4.2.4 Entrepreneurship Ecosystem Pillar 4: Government Policy Factor

Government policies in relation with entrepreneurship such as tax and labor laws, education, dialogues and recognition play in an important role of the development of entrepreneurship ecosystem. The respondents thought that the most important elements of government policies for entrepreneurs were assuring availability of funding for entrepreneurs, helping entrepreneurs start a business, and providing entrepreneurship trainings at 23%, 18% and 15% respectively in Table (4.10) and Figure (4.11).

Table (4.10) Important Elements of Government Policy

| Perception about elements of government policy | Number of Respondents | Percent (%) |
|--|------------------------------|--------------------|
| Entrepreneurship training | 38 | 15% |
| Supporting entrepreneurship incubators and accelerators | 25 | 10% |
| Assuring availability of funding for entrepreneurs | 59 | 23% |
| Creating or supporting worker training programs | 35 | 13% |
| Helping entrepreneurs start a business | 46 | 18% |
| Unsure what the government has done to support entrepreneurs | 28 | 11% |
| Government has not had a policy to support entrepreneurs | 29 | 11% |
| Total | 260 | 100% |

Source: Entrepreneurship Survey Data, 2019

Source: Entrepreneurship Survey Data, 2019

Figure (4.11) Perception on Government Policy

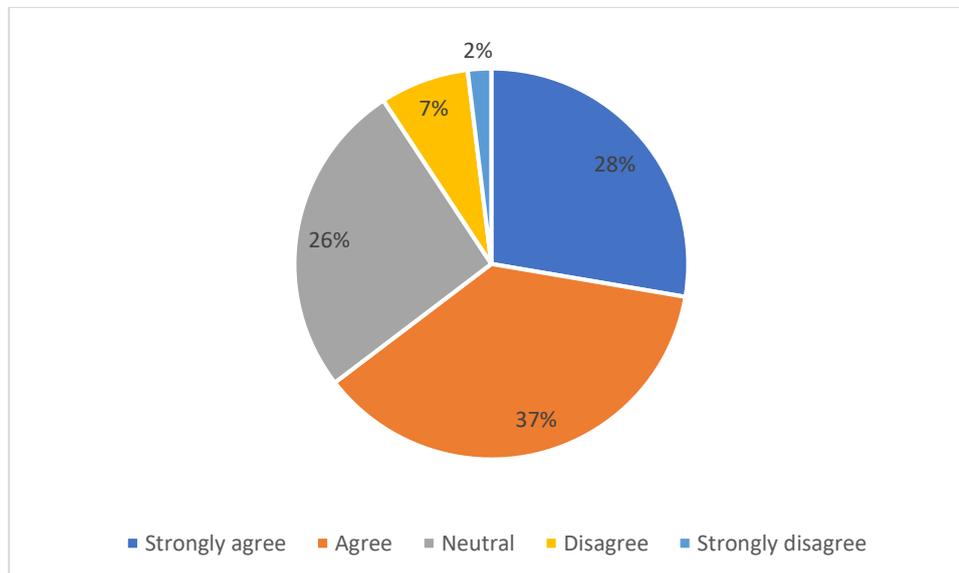

4.2.5 Entrepreneurship Ecosystem Pillar 5: Entrepreneurship Culture Factor

Individuals working within a political and civil society environment that provides encouragement and support for entrepreneurship are much more likely to start new businesses and take the investment and reputational risks associated with

innovation. The entrepreneurship survey and interviews conducted for this white paper reveal that many entrepreneurs receive emotional and financial support from their families and each other. Citizens of Myanmar have high regard for entrepreneurship and risk-taking according to the interpretation of Table (4.11) and Figure (4.12) for being asked about their agreement on social acceptance of entrepreneurs.

Table (4.11) Social Acceptance of Entrepreneurs

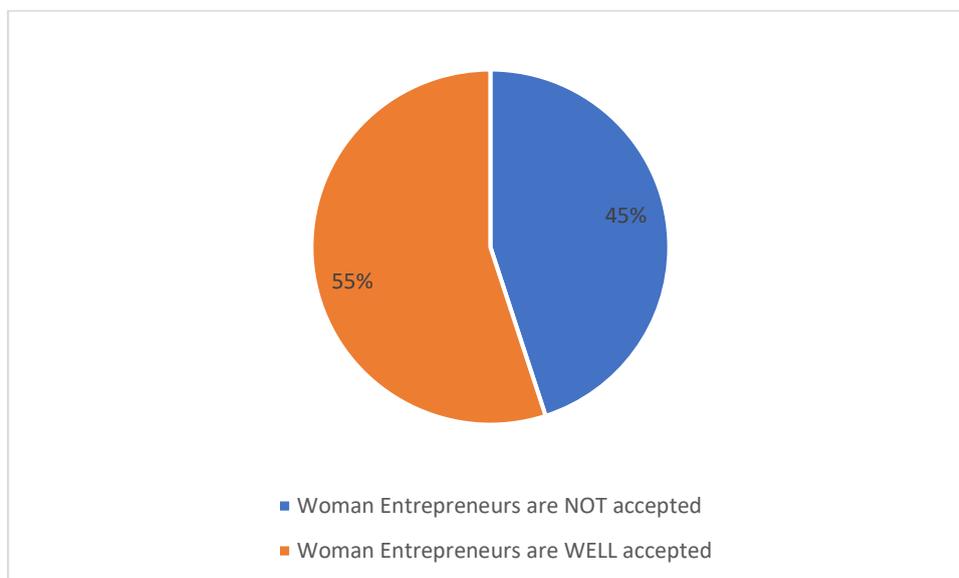

| Perception about social acceptance of entrepreneurs | Number of Respondents | Percent (%) |
|--|------------------------------|--------------------|
| Strongly agree | 72 | 27.80% |
| Agree | 96 | 36.80% |
| Neutral | 68 | 26.10% |
| Disagree | 19 | 7.30% |
| Strongly disagree | 5 | 2.10% |
| Total | 260 | 100% |

Source: Entrepreneurship Survey Data, 2019

Figure (4.12) High Regards of Community and High Risk-taking

In Myanmar, it is not more difficult for a woman than a man to start and grow an entrepreneurial business as per the answers in Figure (4.13).

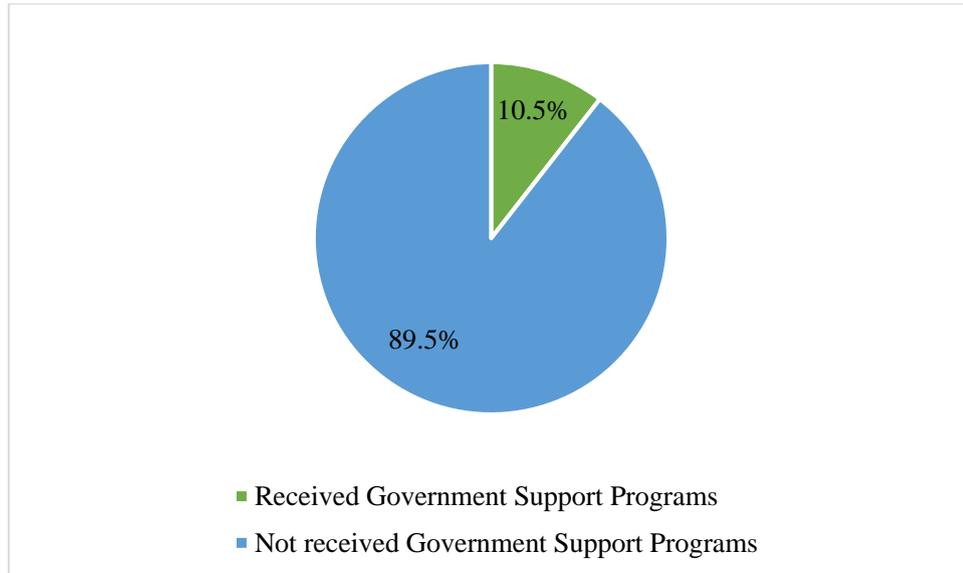

Source: Entrepreneurship Survey Data, 2019

Figure (4.13) Perception on Women Entrepreneurs

4.2.6 Entrepreneurship Ecosystem Pillar 6: Support and Network Factor

Countries that achieve high rates of entrepreneurship do so by having a rich ecosystem of supporting actors and institutions in which the participants are highly connected and interactive. These include networks of startup weekends, entrepreneurship training programs, entrepreneur mentors, angel investors, incubators, accelerators, a rich array of financial support institutions, accountants, consultants and peer-to-peer networks, and links to education and training providers. These networks and support organizations provide encouragement, discipline, seed resources, leadership and management skills, advice, and encouragement. Absent in Myanmar until recently as per the highly negative responses of 89.5% in Figure (4.14), such organizations are beginning to emerge, most noticeably in Yangon but also gradually in other commercially important cities. But Myanmar is only at the start of the process; there is still a long way to go to develop a deep and effective ecosystem of supporting organizations, events, and networks. Myanmar needs to catch up with the more substantial and sophisticated ecosystems of actors that are already seen in a number of countries in the region.

Figure (4.14) Acquisition of Government Support Program

4.3 Factor Analysis

To identify the factors which influence the Myanmar Entrepreneurship Ecosystem, factor analysis approach has been applied. In this study, the principal components method was used to generate the initial solution with 48 variables which are related with six sectors of the strategic pillars which are meant to impact on entrepreneurs among MYEA members. All these sectors finally come out with factors group related to entrepreneurs' answers. The variables are grouped into 6 because the questionnaire is based on the concept of 6 pillars of entrepreneurship ecosystem. The 6 pillars are named as Access to Finance (AF), Access to Market (AM), Access to Technology (AT), Entrepreneurship Culture (EC), Government Support (GS) and Human Resource (HR). Each pillar has 8 questions or 8 variables so that each pillar is numbered from 1 to 8 respectively.

Reliability Analysis to the Impact of Entrepreneurship Ecosystem

This reliability analysis was referred to measure for the accuracy and consistency of collected data. This method was divided into two broad categories, such as external consistency procedures and internal consistency procedures. The reliability statistics results were described in Table (4.12).

Table (4.12) Results of Reliability Analysis

| Cronbach's Alpha | No. of Items |
|-------------------------|---------------------|
| .903 | 48 |

Source: Entrepreneurship Survey Data, 2019

Cronbach's alpha reliability coefficient of overall items calculated as 0.903 which was greater than 0.7, high level of internal consistency for the overall items. The Scale Statistics are at the values of Mean 148.15, Variance 515.366, and Standard Deviation 22.702 for Number of Items 48 as shown in Table (4.13).

Table (4.13) Scale Statistics

| Mean | Variance | Std. Deviation | No. of Items |
|-------------|-----------------|-----------------------|---------------------|
| 148.15 | 515.366 | 22.702 | 48 |

Source: Entrepreneurship Survey Data, 2019

KMO and Bartlett's Test

Bartlett Test of Sphericity test sampling adequacy values were 0.855 and yielded a value of 5290.84 and an associated degree of significance smaller than 0.001. KMO measure of sampling adequacy was 0.855. This means that the collected sample was adequate and the correlation matrix had significant correlations among these collected questions in Table (4.14).

Table (4.14) Kaiser Meyer Olkin (KMO) and Bartlett's Test

| | | |
|--|--------------------|--------------|
| Kaiser-Meyer-Olkin Measure of Sampling Adequacy | | 0.855 |
| Bartlett's Test of Sphericity | Approx. Chi-Square | 5290.84 |
| | Df | 1128 |
| | Sig. | 0.000 |

Factor Analysis (First Run)

Table (4.15) is Factor analysis which used initial solution statistics and KMO and Bartlett's test for sphericity of correlation matrix and also selected Principal components method and extract based on eigenvalues greater than 1. Then selected

varimax rotation method and selected coefficient absolute value are 0.33. This is suppressing of factors loading values less than 0.33.

In factor analysis, output of total variance was presented to extract associated eigenvalues with 13 common factors which was eigenvalue greater than 1. The percentage of total variance was described 26.50%, 6.39%, 6.21%, 4.83%, 3.59%, 3.31%, 3.19%, 3.08%, 2.64%, 2.63%, 2.39%, 2.32% and 2.13% respectively.

This was 69.22% of the total variance attributable to 13 components and other 35 components are only about 30.78% of the variance.

Table (4.15) Factor Analysis Results for Total Variance Explained

| Component | Initial Eigenvalues | | | Extraction Sums of Squared Loadings | | | Rotation Sums of Squared Loadings | | |
|-----------|---------------------|---------------|--------------|-------------------------------------|---------------|--------------|-----------------------------------|---------------|--------------|
| | Total | % of Variance | Cumulative % | Total | % of Variance | Cumulative % | Total | % of Variance | Cumulative % |
| 1 | 12.722 | 26.504 | 26.504 | 12.722 | 26.504 | 26.504 | 8.144 | 16.966 | 16.966 |

Component Matrix

The component matrix presents the 13 components extracted with Principal component analysis method. Variables HR4, GS3, HR1, GS4, AM1, GS1, EC6, EC8, AT3, AM3, AT7, GS2, HR6, HR5, EC1, HR3, HR7, GS5, EC7, AT8, AM8, HR8, AT4, EC2, AT6, GS6 and EC3 are factor 1, variables HR2, AM4, F3, AM7, AF8, and AM2 are factor 2, variables AT5, AF4, and EC4 are factor 3, variable AF6 is factor 4, variables EC5 and AM5 is factor 5 , variable AF5 is factor 6, variable AF1 is factor 7, variable AT2 is factor 8, variable AF7 is factor 9, variable AM6, and AT1 are factor 10, variable GS8 is factor 11, variable GS7 is factor 12 and variable AF2 is factor 13 respectively.

Rotated Component Matrix

In the rotated component matrix presented after 20 iterations rotation converged to using with principal component analysis extraction method and varimax with Kaiser normalization rotation method. The rotation factor structures were shown in the Appendix (III) such as variables GS4, GS3, GS1, GS2, GS5, EC8, EC6, HR4, EC7, HR5, GS6, HR6, AT3, and AM4 are factor 1, variables HR3, AT8, AT7, HR1, HR8, AM3, and AM1 are factor 2, variables EC3, EC2, HR7, EC1, and AM7 are factor 3, variables AT5, AT4, and AT6 are factor 4, variables AF7, AM2, and AF3 are factor 5, variables AF5, and AF4 are factor 6, variables AM5, and AF8 are factor 7, variables GS8, HR2, and EC4 are factor 8, variables AT2, AT1, and EC5 are factor 9, variables AM6, and AM8 are factor 10, variables AF2, and AF1 are factor 11 and variable AF6 is factor 12 and GS7 is factor 13 respectively.

Velicer's Minimum Average Partial (MAP) Test

The determining of MAP test was shown in the following factors focuses on the common variance in a correlation matrix as shown in Table (4.16).

Table (4.16) Velicer's Minimum Average Partial (MAP) Test

| Eigenvalues | Components | Squared | Power4 |
|--------------------|-------------------|----------------|---------------|
| 12.722 | 0 | 0.0721 | 0.015 |
| 3.0687 | 1 | 0.0177 | 0.0012 |
| 2.9796 | 2 | 0.0166 | 0.001 |
| 2.3204 | 3 | 0.0143 | 0.0007 |
| 1.7209 | 4 | 0.0125 | 0.0005 |
| 1.5897 | 5 | 0.0128 | 0.0005 |
| 1.5349 | 6 | 0.013 | 0.0005 |
| 1.4782 | 7 | 0.0131 | 0.0005 |
| 1.2663 | 8 | 0.0132 | 0.0005 |

| 0.6314 | 20 | 0.0253 | 0.0024 |

Source: Entrepreneurship Survey Data, 2019

The smallest average squared partial correlation is **0.0125**

The smallest average 4th power partial correlation is **0.0005**

The Number of Components According to the Original (1976) MAP Test is **4**

The Number of Components According to the Revised (2000) MAP Test is **4**

According to the Velicer's MAP test, the first section describes the eigenvalues generate from PCA on the 48 variables and also it presents which variables' eigenvalues were greater than 1.

Second section presents the smallest average squared partial correlations was 0.0125, the smallest average 4th power partial correlation is 0.0005 and the number of factors corresponding value was 4. Therefore, MAP test indicated four factors only.

Factor Analysis (Second Run)

According to the MAP test analysis, the majority of different dimension on entrepreneurs have four factors in the study. Therefore, the second run of factor analysis was selected for four factors extract in the factor analysis extraction.

Total Variance Explained

The results of second run total variance explained four factors of initial eigenvalues factors were same in four factors of first run. The percentage of total variance in second run was 26.50%, 6.39%, 6.21% and 4.83% respectively. These factors contribute 43.94% of the total variance. The rest of 44 factors were about 56.06% of the variance only according to Table (4.17).

Table (4.17) Four Factor Structure Output for Total Variance Explained

| Component | Initial Eigenvalues | | | Extraction Sums of Squared Loadings | | | Rotation Sums of Squared Loadings | | |
|-----------|---------------------|---------------|--------------|-------------------------------------|---------------|--------------|-----------------------------------|---------------|--------------|
| | Total | % of Variance | Cumulative % | Total | % of Variance | Cumulative % | Total | % of Variance | Cumulative % |
| 1 | 12.722 | 26.504 | 26.504 | 12.722 | 26.504 | 26.504 | 8.110 | 16.896 | 16.896 |
| 2 | 3.069 | 6.393 | 32.897 | 3.069 | 6.393 | 32.897 | 5.921 | 12.335 | 29.231 |

Name of Factors and Variables

The results of factor analysis are shown in Tables (4.19), (4.20), (4.21) and (4.22).

Table (4.19) Support & Network Pillar Factor

| Variable | Questions of Variables | Rotated component values |
|-----------------|---|---------------------------------|
| GS4 | You participated in Business Associations and Industry Working Groups to influence government policy. | .805 |
| GS3 | Tax laws are not an impediment to the development of business. | .777 |
| GS2 | Businesses like mine have access to the needed energy sources at reasonable cost. | .760 |
| GS1 | Businesses like mine have access to the Communications at reasonable cost. | .759 |
| GS5 | The process for registering a business is clear and easy. | .743 |
| EC8 | Another company or entrepreneur in Myanmar greatly inspired you to start your company. | .672 |
| EC6 | It is more difficult for a woman than a man to start and grow an entrepreneurial business. | .633 |
| HR4 | The difficulties or costs of laying off employees has dissuaded me from hiring new personnel. | .620 |
| EC7 | My family members are supportive of my entrepreneurial ventures. | .618 |
| GS6 | National law protects business intellectual property from theft inside the country. | .606 |
| HR5 | The professional skills of the fresh graduates are ready to be in the workforce. | .563 |
| AT3 | Cutting edge technologies over the world can be updated with your own effort. | .515 |
| AF1 | Entrepreneurs usually finance the starting of the business from external sources. | .495 |
| AM8 | You believe that your country's existing distribution system could help you to reach more than 50% of the population. | .454 |
| AM6 | Government Tenders and Projects are Transparent and Equal. | .354 |

Source: Entrepreneurship Survey Data, 2019

According to Table (4.19), the first-factor identifies 15 variables which were related to government policy, support & network (6 variables), entrepreneurship culture (3 variables), human resources (2 variables), access to market (2 variables), access to technology (1 variable) and access to finance (1 variable). The majority of these variables are responding each other. Therefore, this factor can be entitled as "Support & Network Pillar".

Table (4.20) Human and Culture Pillar Factor

| | | |
|-----|---|------|
| AT8 | You are willing to invest major portion of your capital for buying technical devices. | .690 |
| HR3 | The level of mandated non-salary benefits and allowances are a significant obstacle to my hiring new employees | .688 |
| HR7 | Training cost for the capacity development of the employees is considerably high for an entrepreneur | .676 |
| HR1 | Businesses like mine can readily hire workers with the desired knowledge, skills, and abilities | .670 |
| EC1 | Entrepreneurs like me have access to advisors and mentors who can provide helpful guidance | .645 |
| AM1 | Innovation can make your business highly competitive. | .636 |
| EC2 | Citizens of Myanmar in general have high regard for entrepreneurship and risk-taking | .635 |
| AM3 | It is easy to find the market/service for your business locally. | .615 |
| AT7 | You prefer to use update technology to boost up your product or service. | .604 |
| HR6 | Myanmar's education system should be more focus on vocational trainings. | .540 |
| EC3 | You have been part of any business or entrepreneurship training before or after starting your business. | .534 |
| AT4 | It is not expensive to acquire technical input from the outsourcing. | .531 |
| HR8 | Efficiency and Effectiveness of your company's Human resources is satisfactory compared to the hiring cost for them. | .446 |
| EC4 | You received support from a government program or from an international donor program (either financial or non- financial) during the past three years. | .421 |
| AM5 | You have been hiring Professionals for Marketing for your product/service apart from your own intuition. | .331 |

Source: Entrepreneurship Survey Data, 2019

According to Table (4.20), the second-factor identifies with 15 variables that reflected on access to technology (3 variables), human resources (5 variables), entrepreneurship culture (4 variables), and access to market (3 variables). Therefore, this factor shall be named as “Human and Culture Pillar”.

Table (4.21) Market & Technology Pillar Factor

| | | |
|-----|---|------|
| HR2 | I find it easy to retain employees after hiring and training them. | .690 |
| AM4 | It is easy to compete in the market your product/service with International Brands. | .611 |
| AF8 | You believe that your business will be growing faster if you get Non-collateral loans with low interest rate. | .597 |
| AM7 | You are able to spend Enough Marketing Budgets to draw attention of your potential customers. | .505 |
| AT2 | Technical knowhow can be easily accessible for your business. | .484 |
| AF2 | You financed working capital (daily financing needs) from own savings, or from family and relatives. | .350 |
| GS8 | If you have a mentor that Government or an NGO arrange for you, your business will be more successful. | .332 |

Source: Entrepreneurship Survey Data, 2019

According to Table (4.21), the third-factor identifies with seven variables. This factor was found out in two different sectors that reflected on human resource (1 variable), access to market (2 variables), access to finance (2 variables), access to technology (1 variable), government policy and support network (1 variable). Hence, this factor can be nominated as “Market and Technology Pillar”.

Table (4.22) Financial Pillar Factor

| | | |
|-----|---|------|
| AF4 | You can EASILY find an investor or venture capital for your business. | .648 |
| AF5 | Banking regulations for Loan is accessible for your business in every stage. | .607 |
| AF3 | You have gotten growth capital to expand operations by borrowing from Banks. | .581 |
| AF7 | Monetary grants or loans offered by the INGOs or NPOs are relevant for your business. | .506 |
| AM2 | Businesses like mine have access to the Transportation and logistics networks at reasonable cost. | .496 |
| AT5 | Government supports you to upgrade or create your business. | .492 |
| AT6 | You have acquired the technical support of an NGO or NPO or other international trade organizations for the advancement of your business. | .419 |
| AF6 | Bank interest rates for Loan are reasonable. | .393 |

Source: Entrepreneurship Survey Data, 2019

According to Table (4.22), the fourth-factor identifies with 8 variables. This factor was included access to finance (5 variables), access to technology (2 variables) and access to market (1 variable). Therefore, this factor can be named as “Financial Pillar”.

Table (4.23) Factors Affecting among Entrepreneurs in Myanmar

| Variables | Support & Network Pillar Factor | Human and Culture Pillar Factor | Market & Technology Pillar Factor | Financial Pillar Factor |

| AF4 | | | | 0.648 |
| AF5 | | | | 0.607 |
| AF3 | | | | 0.581 |
| AF7 | | | | 0.506 |
| AM2 | | | | 0.496 |
| AT5 | | | | 0.492 |
| AT6 | | | | 0.419 |
| AF6 | | | | 0.393 |

According to the results in Table (4.2), 48 variables and 4 main factors are found related to impacts on Entrepreneurship Ecosystem in Myanmar. Support and Network Pillar, Human and Culture Pillar, Market and Technology Pillar, and Financial Pillar are main factors to build up Myanmar Entrepreneurship Ecosystem. The pillars combine into a unified, and systematic ecosystem. These pillars should be viewed neither as being implemented sequentially nor as any one being more important than any other. These pillars not independent of each other improvements in one pillar will often lead to improvements in others, while weaknesses in one pillar can make conditions more difficult in other pillars.

CHAPTER V

CONCLUSION

Factor analysis was conducted in primary data collection from the members of Myanmar Young Entrepreneurs Association. This chapter is described the key findings, suggestions and further studies.

5.1 Key Findings

This survey was implemented to identify the factors affecting the Myanmar entrepreneurship ecosystem. In this study, information was collected from 260 entrepreneurs. The data collection was completed in 2019. Its goal was to identify the demographic and socioeconomic characteristics of Myanmar entrepreneurs, as well as the main key factors influencing the impact of Myanmar's entrepreneurship ecosystem. Most entrepreneurs are educated to have a bachelor's degree or above. Because only 1% of entrepreneurs went out of business, technical and vocational schools should place a greater emphasis on entrepreneurship.

In this study, most of the entrepreneurs are males with the age groups of 25–29 years and 30-34 years. Most entrepreneurs lived in the Yangon Region and worked in agribusiness and retail trade. The survey shows that a geographic balance of 48% of entrepreneurs from different regions across the country exists, while the Yangon region has only 52%. Regarding the size of employees, most businesses have fewer than 10 employees.

Although wholesale trade and retail trade were fairly represented, there were firms from agriculture, manufacturing, construction, ICT, real estate, education, health care, tourism and others. Concerning foreign investment, most entrepreneurs are not doing exports of their products. Regarding working experience, the majority of entrepreneurs did not have work experience before they ran their own businesses. In addition, most businesses have company registration at the Directorate of Investment and Company Administration (DICA).

The result shows that most of the Myanmar entrepreneurs are SME business runners because only a few of the businesses can employ more than 200 headcounts, which can be so-called medium-sized businesses. Most firms have less than 15 people working for them.

Nearly all the entrepreneurs interviewed were not affiliated with a foreign company. Entrepreneurs can still be affiliated with international companies as franchisees, subsidiaries with equity interest, or joint ventures. They might also be a licensed distributor. Or they can theoretically produce it under license. But only 8% have any such affiliation with a foreign company.

The majority of entrepreneurs (82%) were serving the domestic market, and only 17% were directly exporting. Most entrepreneurs have no experience working for a foreign company, but some of them still have this exposure. Working for MNCs can be a good reason to become an entrepreneur by getting skills, managerial experience, and exposure to best practices. Nevertheless, this was only in about one-third of the cases, whilst the other 64% had no such experience.

Nearly all businesses were legally licensed and registered either by DICA, the municipality, or with a shop license, but 4% said they were not registered at all. This tends to confirm that entrepreneurs tend to be officially registered and to be paying taxes. Nearly 90% of entrepreneurs find personal or family savings are "essential" or "very important" to starting their business. While personal and family savings were by far the most important source of funds, many entrepreneurs found financing from relatives and banks to be "very important."

Entrepreneurs view their competitiveness as being based on their product, technological innovation, and organizational culture. More than 60% of entrepreneurs view technology innovation and the company's business culture as "essential" or "very important" to its competitiveness.

However, about one-third of firms had difficulties hiring workers with the desired knowledge, skills, and abilities. They also report difficulties in retaining employees who are skilled or have been trained by their firm. Roughly one third of respondents did not report problems in these areas, suggesting that this problem is serious for many firms, but others have found ways to adapt.

When asked about the government's recent policies and how they view them, entrepreneurs focus on ensuring adequate financing for entrepreneurs. Others mentioned improving the ability to start a company and encouraging training related to entrepreneurship. But many were unaware of any recent government policies.

The government does not adequately communicate its entrepreneurship-related policies. Twenty seven percent of entrepreneurs feel the government communicates its support for entrepreneurs very ineffectively, while only 5% feel it communicates very

effectively. This means that a major recommendation for government policy is to not only formulate and implement such a policy but to communicate it well and clearly. At the moment, it is not doing a good job in communicating entrepreneurship policies, which may be because the government was still quite new at the time of this survey.

Entrepreneurs report a generally positive culture of support for their activities. More than half of entrepreneurs agree or strongly agree that citizens generally have a high regard for entrepreneurship and risk taking. This is somewhat surprising in a traditional culture where bankruptcy laws are still difficult and where entrepreneurship has emerged only in the last generation or so.

Nearly half feel that it is more difficult for women to start and grow a business. It would be interesting in the next survey to see if there was any difference in perception among male and female entrepreneurs. Only 10% of entrepreneurs received any kind of support from a government program.

Regarding the results of factor analysis, four main factors such as Support & Network Pillar; Human Capital and Culture Pillar; Access to Market & Technology Pillar; and Financial Access Pillar are found to build up Myanmar's Entrepreneurship Ecosystem.

5.2 Suggestions

According to these findings, the four major influencing factors on the Myanmar entrepreneurial ecosystem are the Support and Network Pillar, Human and Culture Pillar, Market and Technology Pillar, and Financial Pillar.

Individual entrepreneurs may apply these identifying factors by strengthening their new ventures to make their entrepreneurial endeavors more successful and long-lasting.

Idea of having an Entrepreneurship dashboard also help the government track the national performance in generating entrepreneurial enterprises and assign action plans to its ministries. The dashboard may track key indicators for entrepreneurial activities and it could also include specific performance milestones for each ministry with respect to entrepreneurship performance. The indicators will alert the attention of senior government officials and the entrepreneurial associations to focus on problem areas while enabling coordination across ministries.

5.3 Further Studies

According to the experience of having this study, it is considerably noticed that the references and sources of Entrepreneurship in Myanmar are very scarce. It is strongly suggested to conduct more entrepreneurial surveys in both academically and professionally. Government shall publish an annual report on the national level of Myanmar entrepreneurship. On the other hand, entrepreneurial associations should take a lead to conduct an annual entrepreneurship survey which will enable to provide response on how policies are being implemented and to assess the overall environment for entrepreneurial growth. The results of the annual survey can be collaborated to produce national level entrepreneurship report that benchmarks progress on entrepreneurship development.

This survey enables to cover only the factor analysis of the key strategic pillars which are perceived as important domains in Myanmar entrepreneurship ecosystem by the members of Myanmar Young Entrepreneurs Association in 2019. While doing this survey, the political and socioeconomical changes in Myanmar comprises which will considerably make a big impact to Myanmar entrepreneurship ecosystem. Therefore, it is strongly recommended to take a quick action on studying updated survey to understand the current scenario of entrepreneurship panorama in Myanmar after COVID-19 pandemic in 2020 and political changes in 2021.

In addition to multiple regression analysis are applied to identify the influencing factors in Myanmar Entrepreneurship Ecosystem.
